Mobile Communication Systems

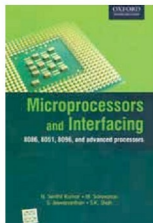

This revised and updated version is an English translation of the Polish version of the book that was first published in 1998. The book, devoted to several aspects of mobile communication systems, evolved from the lecture notes prepared for the telecommunication students at Poznan University of Technology. However, this edition also includes developments in the field of mobile communication systems since 1999.

The 17 chapters of the book attempt to tackle most of the important subjects in mobile communications, including basic theory of digital communication systems, main types of mobile communication systems, characteristics of a mobile communication channel, cellular system concept, GSM and CDMA systems, MPT 1327 standard and DECT.

However, it is not for those who want an in-depth knowledge of the subject as it does not go into great detail when presenting examples of mobile communication systems. Readers interested in detailed information will have to consult references included at the end of each chapter or study other more specialised books.
