

TEXAS
INSTRUMENTS

Key Solution Features:

- Industry leading drivers
- Power of the C28x core coupled with highly integrated control peripherals
- Complete power solutions
- Single, dual, and quad low voltage, low power Operational Amplifiers
- Industry leading lumens/watt (efficacy)

The diagram illustrates a power management system for a smart meter. It shows the flow of power and control signals. Power enters from a 'Power Grid' through a 'Transformer' to 'Loads'. A 'Storage Batteries' unit is connected to the system. The power path includes a 'DC/DC' converter, a 'FET' (driven by 'MOFET Drivers'), and a 'Protection' block. The control path involves a 'Processor' (C2000 or MSP430 Controller) which manages 'PWM' signals, 'Battery Control', and 'Relay Driver' (controlling 'Relays'). Communication is handled by 'System Communication Interfaces' (FRIF, CAN, RS232/RS485). 'IV Sense' blocks monitor current/voltage at multiple points. An 'Isolation' block separates the power and control paths.
