

Research & Development

Whether you are making RF measurements or performing signal characterization for research and development, manufacturing or installation & maintenance applications, the Anritsu family of spectrum analyzers has everything you require to solve all your measurement needs. These instruments deliver the features and performance you need to operate in both field and lab environments. Their range of capabilities (e.g., high-speed, wide resolution bandwidth, high dynamic range, support for multi-functionality and affordability) ensure fast, efficient and reliable measurement results. With the Anritsu family of spectrum analyzers, signal analysis will never be the same again.

Performance and Capabilities to Support a Range of Applications

The availability of high-performance benchtop instruments, as well as handheld instruments, that combine powerful measurement capabilities with support for a range of frequencies and bandwidths, make Anritsu's spectrum analyzer family ideal for a range of applications.

The Challenge

During R&D, next-generation communications applications like Base Transceiver Station (BTS) test, User Equipment (UE) transmitter testing, and mobile backhaul testing (e.g., for 3GPP including TDD LTE, EDGE evolution, and HSPA+) can prove especially difficult. Today's increasingly data-intensive applications are driving wireless communications devices to use wider bandwidths and higher frequencies (above 3 GHz). With greater bandwidth usage, the ability to discriminate between different signals becomes more challenging. Without accurate measurements, the transition into manufacturing also poses an obstacle, even resulting in increased cost when problems are not found early in the design cycle. Overcoming these test challenges requires a fast and accurate spectrum analyzer that is able to measure above 3 GHz.

The Solution

The MS269xA Series Signal Analyzers offer the level accuracy (± 0.3 dB typical), wide dynamic range, high performance and flexibility necessary to quickly, easily and cost-effectively test next-generation communication applications for even the most demanding R&D environment. Because of its accuracy, the MS269xA Series is able to measure the widest signals and, using the latest technology, make measurements faster than ever before. Three different models provide frequency coverage to 6 GHz (MS2690A), 13.5 GHz (MS2691A), and 26.5 GHz (MS2692A), and can be used to perform swept spectrum analysis and fast Fourier transform (FFT) signal analysis. The wideband FFT signal analyzer supports high-speed continuous measurements including CCDF, frequency vs. time, spectrum, and power vs. time analysis. All three models feature a precision digitizer function that enables waveform capture. The addition of an optional signal generator turns the MS269xA Series analyzers into a cost-effective one box solution that dramatically reduces footprint and total average cycle time for device evaluation, and allows the instrument to easily scale as measurement requirements change.
