

Installation & Maintenance

The Challenge

Properly installing and maintaining wireless networks is critical to ensuring best-in-class network reliability and good Quality of Service (QoS). Consequently, routinely testing a base station's cables, filters, antennas, and amplifiers, and troubleshooting internal and external interference is critical. Difficulties arise due to increasingly complex wireless networks and soaring operating frequencies. Additionally, with more and more wireless communications systems being deployed, interference from both indoor and outdoor transmissions becomes problematic. Moreover, many of these deployments are now in remote locations and sometimes in harsh environments, making testing more difficult. Overcoming these challenges and optimizing network reliability requires the right spectrum analyzer for the task at hand.

The Solutions

Anritsu offers a number of spectrum analyzers to address your installation and maintenance needs. Instruments are available in both the mid-performance and high-performance range and come with a wide variation of features and capabilities to address specific measurement needs.

The MS2711E Spectrum Master™

Use: Installing, provisioning, maintaining, and troubleshooting wireless systems and RF frequency spectrum interference issues. It is particularly well suited for cellular providers and land mobile operators conducting interference analysis and military spectrum analysis.

The MS2711E is designed to handle the most punishing field conditions and monitor wireless systems with the greatest ease. Convenient operating procedures, high sensitivity and excellent repeatability enable it to pinpoint the smallest system performance degradation and allow for easy verification of system compliance.

Additionally, the MS2711E can locate and identify out-of-band spurious signals when analyzing a wireless base station transmitter. When in field strength mode, it allows users to measure propagation and coverage, or to pinpoint electromagnetic (EM) leakage in broadcast systems. Measurement of carrier to interference (C/I) ratio and spectral emission mask is also included.

The MS2712E/13E Spectrum Master™

Use: Monitoring, locating, identifying, and analyzing a broad range of cellular, 2G/3G/4G, land mobile radio, Wi-Fi, and broadcast signals.

The MS2712E/13E Spectrum Master features a field-proven design that can handle even the most challenging field conditions. As a multi-functional instrument, it incorporates a spectrum analyzer, interference analyzer with interference mapping, and a high-accuracy power meter. This multi-function capability eliminates the need to learn and carry multiple instruments when locating and identifying signals over wide frequency ranges.
