

## Using the MCS-51 Microcontroller (Indian Edition)

Meant to serve as an introductory textbook on microcontrollers, this book covers both theoretical and design, and implementation issues of the Intel MCS-51 family – commonly referred to as 8051.

Spread across ten chapters, the book includes extensive program and interfacing examples. Many examples are used in exploring the application and design alternatives. Laboratory projects, assignments and exercises are provided in eight chapters. The evaluation board used is MCB520 by Keil Software.

The accompanying CD includes application notes, datasheets, utility programs, software needed to install C51eval and an evaluation version of MCS-51 development tools.

## Programming and Customising the PIC Microcontroller: Third Edition

Long known as an authoritative textbook on the subject, this third edition helps the readers get a firm grasp on PIC microcontrollers with its coverage of hardware and software schemes. The book focuses on three major PIC families and emphasises the use of high-level languages. It helps the readers understand the synergy between Assembly, BASIC and 'C' programming languages.

The book contains more than 600 illustrations as well as libraries. There are a hundred experiments that explain how a PIC is programmed and used, projects that demonstrate how the PIC can interface with different devices, and various developers' tools used for application software development.

The book covers the latest program development tools, a refresher in electronics and programming, useful tables and data, useful circuits and routines, PIC microcontroller basics and a section on setting up your own PIC microcontroller development lab.

## Real-Time Systems: Scheduling, Analysis and Verification

This book includes basic real-time scheduling algorithms, schedulability analysis, the background in logic and automata theory, and concepts underlying formal methods for real-time systems.

Across twelve chapters, the text aims at making the most of state-of-the-art materials accessible to students while serving as a reference for practitioners and researchers. Common to every chapter is a description of the available design, analysis and verification tools, a section on historical perspective and related work, a summary and a set of exercises.

The book describes the application of techniques and tools to a variety of industrial and toy examples. Examples include automatic air-conditioning and heating unit, simplified automobile control, smart traffic light system for a traffic intersection, railroad crossing, mutual exclusion problem for processes, NASA X-38 crew return vehicle avionics, NASA Mars Odyssey Orbiter, message sending and acknowledgment, and airport radar system.
