

Green Buildings Converge Intelligence With Nature

Old buildings can be turned into environmentally sustainable structures. New buildings can be designed for sustainability. Read on to find out how dwellings and offices can be made green, kept green

CONFEDERATION OF INDIAN INDUSTRY (CII) SOHRABJI GODREJ GREEN BUSINESS CENTRE

A green building uses less water, is energy-efficient, conserves natural resources, generates less waste and provides healthier spaces for occupants—compared to a conventional building.

Technically, the design, construction and operation of green buildings should incorporate technologies that

are ecologically superior, enhance the comfort of occupants, and are around nature and sustainability. The prime components that go into the making of a green building make the most efficient and optimised use of the elements of nature, reducing dependence on energy-guzzling equipment.

Convergence is the key

Green buildings in India are a good example of how ancient architectural heritage and latest technological in-

novations can blend to create sustainable green habitats. The merging of various IT and electronic systems creates a dynamic, sustainable architecture.

Some of the electronics and IT components of green buildings are light-emitting diode (LED) lighting, high-frequency electronic ballasts, temperature and relative humidity sensors, CO₂ and CO sensors, solar photovoltaic (PV) and building-integrated solar PV systems, intelligent
