

Building automation system (Courtesy: En-Wikipedia/mat_the_w)

can save up to 40 per cent on energy and operating costs. The payoff period of energy harvesting wireless solutions in a building automation system is between two and three years.

More than 250 companies worldwide from the building sector have come together to form the EnOcean Alliance and establish automation solutions for sustainable building projects. Currently, there are more than 850 products available, which are all interoperable and based on the energy harvesting wireless technology. Green buildings solutions based on this technology are:

1. Batteryless, wireless switches to control lighting and shading

2. Batteryless outdoor light sensors, which automatically match lighting to daylight

3. Occupancy sensor, which adjusts temperature and turns lights off when a room is not in use

4. Room temperature sensor for minimal energy consumption

5. Climatic (humidity and CO₂) sensors, which monitor indoor air quality

6. Position sensors—e.g., window handle and window contact—that cut out heating and air-conditioning when windows are open

7. Central control on a touch panel or PC

8. Remote monitoring and control by a mobile phone or on the Internet

Energy-saving LED lighting

Lighting is one of the most attractive and easy ways to save on your electricity bills. It consumes 19 per cent of all electricity in the world. Replacing energy-inefficient lighting with green alternatives has an immediate impact on energy use, CO₂ emissions and the environment.

For light sources, Philips is developing solidstate lighting solutions with increased efficiency and lower costs. In controls, it is developing a range of standalone solutions with dimming, occupancy and daylight sensing applicable to small- and medium-sized buildings. For large buildings, Philips
