

High Voltage Full Bridge driver for Inverter/UPS applications

TI's SM72295 is designed to drive 4 discrete N type MOSFET's in a full bridge configuration. The drivers provide 3A of peak current for fast efficient switching and integrated high speed bootstrap diodes. Current sensing is provided by 2 transconductance amplifiers with externally programmable gain and filtering to

remove ripple current to provide average current information to the control circuit. The current sense amplifiers have buffered outputs available to provide a low impedance interface to an A/D converter if needed. An externally programmable input over voltage comparator is also included to shutdown all outputs. Under voltage lockout with a PGOOD indicator prevents the drivers from operating if VCC is too low. The SM72295 full-bridge driver is well-suited for UPS and inverter requirements for Indian market.

Key Features and Benefits

- Dual Half Bridge MOSFET Drivers
- Integrated 100V bootstrap diodes
- Independent High and Low driver logic inputs
- Bootstrap supply voltage range up to 115V DC
- Integrated dual current sense amplifiers eliminate need for two differential amplifiers and reduce BOM count
- Capable of driving full-bridge configurations with a single IC
- UVLO with power good indicator eliminates need for discrete supervisory chip voltage range up to 115V DC
