

breeze through most tasks. 4 GB of RAM is sufficient for most tasks, unless you handle large files such as RAW image files. However, the Intel HD 3000 integrated graphics card is not known for its performance. So it would be best to let a mainstream system handle the computing tasks while you use the Ultrabook for presenting them.

Samsung Series 9

The differentiator for this 33cm Ultrabook is its 400-nit (400Cd/m²) Super-Bright Plus display. The device sports a high-resolution (1600x900) display and, at 1.25 kg, is lighter than the rest. It also features a card reader. On the down side, it is more expensive than the Dell Ultrabook.

The high-resolution display of this computer may not be particularly useful for those who would be using the device more for text and less for imaging. The high resolution tends to make the text much smaller than what standard notebook users are used to.

This Ultrabook sports an i5 Sandy

Samsung Series 9

Bridge processor, which is slower than the rest of the pack but sufficient for day-to-day use.

Lenovo IdeaPad Yoga

The IdeaPad is unique in that it has the capability to convert into a tablet. Utilising dual-hinge technology, the notebook is capable of folding into multiple positions as required. The

Lenovo IdeaPad Yoga

gyroscope within the display helps align the display in the correct orientation. This Ultrabook also features more memory than competing products as it comes with a full 8GB RAM and a 256GB SSD.

The ability of this laptop to convert into a tablet has attracted a lot of people to this device. Couple this factor with higher memory than the competition and you have a very versatile device. The only apprehension is whether the hinges will be able to sustain all the movement from 'Tent-mode' to 'Tablet' to 'Ultrabook.'

The IdeaPad Yoga is slated to come with an Ivy-Bridge processor, which will provide about 30 per cent greater performance at lower power consumption. The integrated Intel HD graphics on this system will also be far more powerful than the current crop. Coupling all this with its superior memory makes this system fully loaded. If you plan to do CPU-intensive tasks, this is the ma-

chine to get.

HP Envy 14 Spectre

This device features a larger display than the rest of the

HP ENVY 14 Spectre

pack. It looks like an Apple notebook but the differentiator here is that it comes cloaked in Gorilla Glass and is priced slightly higher than a 33cm MacBook Air. It features a MacBook Air style keyboard but the keys have a soft-touch finish. The touchpad that comes with this Ultrabook is the best in the lot and competes with Apple's glass touchpads in terms of smoothness and usability.

This device is sleek and glossy. The i5 processor is standard, and the 4GB RAM and 128GB SSD are passable. If you need a no-frills Ultrabook, consider this device.

Apple MacBook Air

This is the device that inspired the Ultrabook movement and forced PC manufacturers to innovate. It comes with a Macintosh operating system

Apple MacBook Air

(Mac OS X Lion), but you can still run Windows on the machine using Boot-camp software that comes bundled for free. You have to buy your own copy of Windows, though.

The MacBook Air is the only ultraportable device available for a Mac OS. A 28cm (11-inch) version of this device is available but it performs a bit lower than this version. The downside of this device is that running Windows OS on it could be a chore at times.

The second-generation i5 on the MacBook Air might not be the
