

fastest on paper but due to the refined nature of the Mac OS you would be able to enjoy a great user experience. Again, 4 GB of RAM is not great, and an upgrade to 256GB storage is highly recommended. Get yourself a good external HDD as 128 GB does not cut it. Also, note that all the memory on the MacBook Air is soldered onto the board and there is no possibility for upgrades on this device. Even the 256GB storage is soldered flash memory and not a 'real' SSD.

quirements. Nevertheless, as its width and depth are smaller than a regular notebook, it cannot be ignored. The Alienware M11x R3 is the third revision of the world's smallest and lightest gaming notebook. Equipped with a choice of the latest second-generation Intel Core i5 or Core i7 processors and Nvidia GeForce GT 540M graphics, this high-performance 28cm notebook is arguably in a class of its own.

If you are looking for a high-performance yet portable laptop that can handle almost every game title, this is the device for you. The downside, however, is that it is the heaviest portable featured here, probably due to the discrete GPU and an actual 7200rpm HDD.

Standard CPU (Sandy Bridge) with

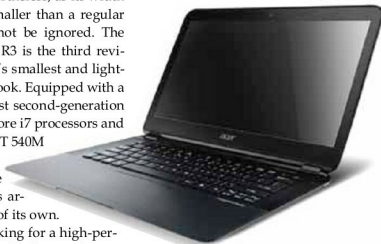

a high-performance GPU (Nvidia GT 540M) and an actual HDD (7200rpm, 500GB) makes this system the most powerful portable laptop available that can play games decently.

Acer Aspire S5

Acer claims its Aspire S5 to be the world's thinnest Ultrabook. The S5 features a couple of Acer technologies like Acer Green Instant On, which is said to bring the notebook back from sleep mode in less than 1.5 seconds, and Acer Always Connect, which promises to quickly reconnect you with any online service you're logged into when your computer went to sleep. It also lets you wake up the S5 via smartphone.

Lastly, this device features the Thunderbolt port, which allows lightning fast transfer speeds. However, accessories that support Thunderbolt are expensive.

The Ivy Bridge processor and 8 GB of RAM make this system capable of handling most tasks. It would give far better uptime than the rest of the Sandy

Bridge laptops (Air 13, M11x R3, Envy 14, Series 9, XPS 13) but also cost slightly more than them. ●
