

Industrial Automation and Control Market in India

India, where industrial automation started in the 1990s, has till date only scratched the surface. A lot still needs to happen. While some industries like the automotive and automotive component industry have done well, we still have low productivity in our factories

UMA GUPTA

In the last couple of years, the automation industry in India grew at an average of 12 per cent per annum. Today, it is approximately Rs 120 billion in size and has the potential to grow by 15-20 per cent given the existing capacity addition in manufacturing, infrastructure and energy sectors. "Manufacturing sector concerns

persist because other than some major ongoing oil and gas projects, there was no major investment. Hopefully, by the

end of this year, investments in oil and gas, fertiliser, petrochemical and cement sectors would pick up and boost a big segment of the automation industry," inform Anup Wadhwa, director, Automation Industry Association (AIA), and K. Nandakumar, president, AIA.

Market components and trends

Somshubhro Pal Choudhury, managing director, Analog Devices India (ADI), says, "Industrial automation and control market is hard to define as it encompasses several classes of equipment across several industry verticals. Many of the companies do turnkey projects, which implies that software and services get included in their revenue as well."

"As such automation products and solutions are oriented along three categories: Continuous process control applications (as in chemical, food and beverage, oil and gas, life sciences, traditional power generation, pulp and paper, waste water, etc), job work and batch production applications (as in automotive, fabricated metals, plastics,
