

changes only when it receives 'motor11 on' or 'motor11 off' message from the phone or when water level goes below sensor A.

The code as well as circuit diagram are correct. Compile the program code using Keil µVersion3. Connect the circuit step by step, checking the output at each stage.

After connecting the GSM modem to the circuit, make sure that your GSM modem has a good signal strength. This can be checked by giving a ring to the SIM used in the GSM modem. If you get a ring tone, or the LED in the modem blinks, that means it's ready to use.

During testing, I found that my GSM modem didn't support Airtel SIM, so I used Vodafone SIM in my prototype.

Arduino-based Shadow Alarm

In 'Arduino-based Shadow Alarm' construction project published in February issue, on page nos. 107 and 108, it was mentioned that the new version (latest version) of Arduino Uno is R2.

But Arduino R3 (Revision 3) is already available in the market. Also, there are slight differences between the R2 and R3 PCB development boards in terms of component placement.

Gurunath Reddy M.
MS Student, IIT Kharagpur

The author T.K. Hareendran replies:

Yes, I am well aware of the developments in Arduino platform. At the time

of design submission, only UNO-R1 was available and I preferred Arduino IDE 0022 with '.pde' (now '.ino') extension for the design work.

Uno, the latest in a series of USB Arduino boards, is the reference model for the Arduino platform. Revision 2 of the Uno board has a resistor pulling the 8U2 HWB line to ground, making it easier to put into DFU mode. Revision 3 of the board has many useful features. Needless to say, now I am using UNO-R3 and the latest Arduino IDE. Thanks for your keen observation!

AVR Programmer

I am a regular reader of EFY, interested in "Standalone GPS Receiver with LCD Display" construction project published in January issue. I purchased all the components required for this project. I have also downloaded the source code from efymag.com website. Please let me know which programmer kit will be suitable for this? I request you to give me the detail information about how to handle the programmer kit.

S. Sathish Kumar
Madurai, Tamil Nadu

EFY: Please contact our associates M/s Kits'n'Spares (info@kitsnspares.com) to get the AVR programmer. You can load hex code into ATmega16 using this programmer. Different products have different manuals and operations. Normally, the manual or user's guide comes along with the product.

Remote Control Using Wireless Doorbell

This is in reference to "Remote Control Using Wireless Doorbell" circuit published in January issue of EFY. I want to use this circuit in a different way. Here are some queries:

1. I want to use this device by replacing wireless doorbell receiver unit including the buzzer by an electronic clock. Can this be done? If yes, what changes are needed?

2. According to the circuit description, the output of IC1 may be changed from 8 minutes to 50 minutes by adjusting VR1. I want this period to vary from 10 seconds to 2 minutes. What changes are needed in the circuit?

3. In the circuit description on page 124, in the second column "When doorbell rings, it produces AC signal, which is rectified by diode D1. Transistor T2 conducts, pulling its collector low. Is it transistor T1 or T2? Please clarify.

N.C.Sinha
Gurgaon, Haryana

The author Raj k Gorkhali replies:

You can try using an electronic clock to this circuit at the buzzer terminal. But remember to check the correct polarity. Transistor T1 should be forward biased while buzzer is working. You may reduce the values of R4 and VR1 to get the time period from 10 seconds to 2 minutes. Please read T1 instead of T2.
