

collisions and accidents at road crossings. If the system detects a hazardous situation, the driver is prompted to apply the brakes immediately. If braking is too slow, the brake pressure is automatically increased to avoid collision.

360-degree camera. A 360-degree camera assists the driver in parking, enabling all-round visibility with all four sides of the vehicle in view. It provides a top-down view of the car and its immediate surroundings.

Steering assistance. The DISTRONIC Plus proximity control system with steering assist feature ensures a desired distance from other vehicles. It monitors both the longitudinal and lateral movements of your car at speeds of up to 200 kmph, and guarantees direction stability with lateral lane guidance.

BlueEFFICIENCY. This feature reduces fuel consumption by up to 12.1 per cent while maintaining the same level of performance.

ECO display. ECO display in the instrument cluster analyses individual driving styles and provides specific tips on how to reduce fuel consumption. Three bar-type chart displays provide feedback on the economic efficiency of the driving style and point the way to potential savings.

4. BMW

iDrive. This intuitive panel in BMW cars helps control entertainment, information, communication and navigation functions. It comprises a control display and a controller, and features a high-resolution glare-free screen, attractive visuals, animations, simple menus, biometric features and voice control.

Multi-function steering wheel. Keys are ergonomically integrated in the steering wheel and programmed to activate often-used features including HVAC (heating, ventilation and air-conditioning) control and cruise control. In some models, two additional keys are left free so that these can be programmed for any function

as per the user's needs.

Integrated navigation system. It combines navigation, office and multimedia functions. Sensors monitor wheels and the steering angle and can localise the vehicle at all times. The system is reliable and can navigate even when the GPS signal is weak. The functions complement each other; for instance, the volume is automatically lowered before a navigation announcement is made. The system features a high-resolution display; virtual, photo-realistic 3D views; fast 1.3GHz processor with built-in graphics chip; control display for computer functions; and a 20GB hard drive for multimedia data.

5. Ford

Hands-free lift-gate. Using motion-sensing technology, Ford Escape allows quick and easy access to the cargo area without keys.

Extensive driver assistance. With more than 145 actuators, 4716 signals and 74 sensors including radar, sonar, cameras, accelerometers, temperature and even rain sensors, the 2013 Fusion car can monitor the perimeter around it and see into places that are not readily visible from the driver's seat. Sensors produce more than 25 GB of data per hour, which is analysed by more than 70 on-board computers. Actuators combined with signal information from driver-assist sensors can alert the driver to potential dangers, actively assisting in parking and lane keeping.

Intelligent decision-making. Ford is researching the use of real-time sensor data—radar- and camera-based—to evaluate external factors affecting driver attention such as traffic congestion, and thus limit potential distractions such as incoming phone calls.

Upgradeable, customisable hardware. Ford's OpenXC research platform drives community-driven innovation of plug-and-play hardware modules that provide infinite opportunities for rapid customisation.

Ford SYNC. The success of this integrated in-vehicle infotainment
