RECENTLY INTRODUCED IN INDIA, FROM NEAR AND FAR

COMPONENTS

High-output electric double-layer capacitors

ROHM has recently launched thin, high-output electric double-layer capacitors (EDLCs) featuring the industry's highest voltage (3.0 V).

Through optimised material selection and proprietary processes, ROHM has successfully achieved the industry's highest voltage. In addition, an internal resistance of 25 mΩ was achieved by devising a surface treatment for the collector electrode that reduced the interfacial resistance (a primary resistance factor) to zero.

The result is higher voltage with less resistance, making them ideal for a wide variety of applications. A thin aluminium laminate package is used for higher output while also contributing to end-product miniaturisation.

Inductors for automotive applications

Vishay Intertechnology has launched two new IHTH high-current, high-temperature through-hole inductors in the 0750 and 1125 case sizes. For automotive applications, the AEC-Q200-qualified IHTH-0750IZ-5A and IHTH-1125KZ-5A handle high operating temperatures of +155°C, high rated currents of 125 A, and a wide range of inductance values from 0.47 μH to 100 μH.

With a frequency range of up to 10 MHz for some values, the devices serve as high-performing, space and power

saving solutions for voltage regulator modules (VRM) and DC/DC converters. The IHTH-0750IZ-5A and IHTH-1125KZ-5A are designed for high-temperature automotive applications, including engine and transmission control units, diesel injection drivers, LED drivers, HID lighting and noise suppression for motors in windshield wipers, power seats and mirrors, and heating and ventilation blowers.

MOSFET for relay drivers

Toshiba Corporation has launched a MOSFET, SSM3K337R, for relay drivers. The new device uses an active clamp structure that prevents over-voltage when the inductive load of relay devices is switched off.

The SSM3K337R reduces on-resistance by half and improves the allowable power dissipation by approximately 1.6 times than that of equivalent products. Its key features include an active clamp structure, which reduces the stress caused by the inductive load of relay devices; and it comes with the SOT-23F package.

Cost-effective ARM computer module

Toradex System has launched Colibri Vxxx, the most cost-effective ARM computer module ever introduced to the embedded market. Based on Freescale's Vybrid automotive grade processor family, we expect to ship first samples to customers in beginning of Q4/2013.

Colibri Vxxx is pin-compatible with the existing range of Colibri modules, allowing the vast majority of existing designs to be easily migrated. The new module also introduces additional features, including on-board CAN support, an increased number of ADC/PWM channels, and analogue video capture inputs.

Some module variants will also combine a Cortex A5 application processor with a real-time Cortex M4 core, providing great flexibility across a diverse range of application areas. In-house support for Linux and Windows CE are on the roadmap.

New COB series

SemiLEDs has announced its new and one of the biggest portfolios of COB series ranging from 10 W to 120 W. In line with SemiLEDs tradition, the technology used in these products have been designed to provide high performance and high reliability, making them suitable for demanding lighting applications where lifetime and colour consistency are major concerns.

The SemiLEDs COBs have highest efficacy of up to 120 lm/W, high lumen maintenance (≤ 5 per cent decay at 90°C/6000 hrs), lowest thermal resistance ($R_{th} \leq 0.5^\circ\text{C/W}$) and they extend lifetime and colour quality.

With these products it is easy to
