RF reference signal generator

Rohde & Schwarz has launched a complete testing environment for nearly all audio, video and multimedia applications—in a single device. The RF reference signal generator generates RF signals for all global TV and broadcast-

ing standards and simulates transmissions. The generator can also internally analyse the audio/video functions of DUTs in real time. The modular design provides a high degree of scalability, allowing the R&S BTC to be configured for any customer requirement.

The R&S BTC reference signal generator enables users to perform complete end-to-end tests in real time over all open systems interconnection (OSI) levels. DUTs can also be integrated into fully automated test sequences. This all-in-one generator may handle today's and tomorrow's transmission standards.

Video and audio streams can be generated, played back, fed externally and output in modulated form. The R&S BTC combines signal generation, DUT embedding and video/audio analysis while simultaneously determining the picture failure point (PPF). The result is fast, convenient and reproducible objective picture quality assessment.

Through-hole reflow PCB connectors

Based on through-hole reflow (THR) soldering technology, Phoenix Contact has launched a wide range of PCB connectors in accordance to IPC/JEDEC J-STD-020D standard. The design, material selection and packaging of THR components meet the requirement of an automated assembly and reflow soldering process.

The product series include single-row headers, double-row headers, high-temperature PCB terminal blocks and high temperature pin strips for plug-in terminal blocks. The products provide high temperature stability in all conventional and lead-free soldering methods.

These PCB connectors can increase production efficiency with a reduction of up to 30 per cent manufacturing costs, saves time due to fully automatic double-sided SMT PCB assembly with tape-on-reel packing according to IEC 60286-3. They have innovative locking feature that enable high mechanical stability even in shock and vibration.

Boundary scan test system

GOEPEL electronic has complemented its range of boundary scan complete packages with a new option. SCAN-FLEX Designer Studio is a complete boundary scan test system including hardware, software and a one-year maintenance contract offering an extremely reasonable price-performance ratio. It has been developed for test and debug tasks in complex projects and higher system performances in both design and production stages.

The package's hardware is pre-configured to be prepared for the utilisation of embedded system access (ESA) technologies such as ChipVORX and VarioTAP, and can be extended by additional I/O modules for further test and programming tasks.

LED-based emergency signage

Binay Opto Electronics Pvt Ltd has launched an LED-based low-power long-life emergency exit/escape route sign, which can lead to savings of more than ₹1000 per year in power consump-

tion costs compared to the conventional CFL exit signs. At the same time, it provides maintenance-free solidstate lighting with a warranty of five years.

This sign comes with a 4W (single sided/per side) LED with a battery life of two hours. It has a lux level of 150-200 from a 30cm distance, with adequate area illumination.

PCB cleaner for low standoff components

ZESTRON, the leading manufacturer of cleaning agents for SMT production, presents the PCB cleaning agent VIGON A 201 to the Indian market. The MPC-cleaning agent provides excellent cleaning performance in capillary spaces. Therefore flux residues even under low standoff components, such as micro BGAs, flip chips and 01005 components can be reliably removed.

Being used at low concentration VIGON A 201 offers a wide process window and is especially suitable for removing fluxes from leaded as well as lead-free NoClean solder pastes. Its good compatibility with sensitive metal alloys leading to shiny solder joints after cleaning, without any additives being necessary, is another main advantage of the product.
