

CSIR to launch India's fastest supercomputer

The fastest of Indian supercomputers is slated to be launched very soon at CSIR's first ever big data science institute in Bengaluru.

The supercomputer will have a 360 tera flops speed and will be the fastest machine in the country when operational. The machine will be housed at CSIR Fourth Paradigm Institute, also known as CSIR-4PI. With the machine in place, the Bengaluru-based Center for Mathematical Modelling and Computer Simulation (CMMACS) will be repositioned to deal with intensive data driven

Itskev, the conference featured Ray Kurzweil—an inventor, futurist and presently director of engineering at Google. His prediction states that by 2045, technology will surpass human brainpower to create a kind of super intelligence—an event better known as singularity.

State-of-the-art motor brain machine interfaces are being developed by Jose Carmena and Michel Maharbiz, electrical engineers at the University of California, Berkeley. Electrical activity that encodes a simple short-term memory (such as pushing a button) and converts it to a digital signal is recorded by the device and then the signal is passed

scientific discoveries, which is also the fourth paradigm of modern science.

Humans will be able to upload their brain on computers by 2045: Futurists

Some futurists are of the opinion that human beings will be able to upload their brains on computers by 2045. The Global Future 2045 International Congress, a futuristic conference that was recently held in New York, dwelt upon this notion. A brain child of Russian multimillionaire, Dmitry

onto a computer where it is mathematically transformed and then fed back into the brain, where it gets sealed in as a long-term memory.

The concept of 'mindclones' was introduced by Martine Rothblatt, a lawyer, author, entrepreneur and CEO of biotech company United Therapeutics Corp.

Japan to send world's first talking robot-astronaut to space

Japan is all prepared to send world's first talking robot-astronaut, Kirobo,

to space. Sharing this news, Kirobo project manager Yorichika Nishijima said, "Russia was the first to travel outer space, the US was the first to reach moon, but we want Japan to be the first to send a robot-astronaut, which has the ability to communicate with humans, in space."

According to a Stuff.co.nz report, Kirobo is just about 34cm tall and weighs about 1 kg. It is set to be launched from the Tanegashima Space Center on August 4, 2013.

AR glasses enable lecturers to know when students have doubt

Scientists at la Universidad Carlos III of Madrid (UC3M) have developed a system based on augmented reality, which will enable the teachers to know the number of students who have understood the lesson and those who have doubts.

Usually in classrooms many students hesitate in clearing their doubts either due to the fear of the professor or being laughed at by fellow students. This behaviour of students encouraged the scientists to develop Augmented Lecture Feedback System.

The students can make use of their smartphones in sending symbols like question mark to let the lecturer
