

BINAY - Lighting Up The Future

BINAY LED-based HIGH, MEDIUM AND LOW Intensity Aviation Obstruction Light Beacons

As per International Civil Aviation Organisation (ICAO) requirements Available in Low Intensity, Medium Intensity and High Intensity versions (as per International Civil Aviation Organization guidelines), BINAY's patented LED Aviation Lights come with 5-year/2-year warranties

LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick Installation; Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED intensity degradation over its operating lifetime

THE BINAY LED OBSTRUCTION LIGHT IS UNDER ACCEPTED PATENT, AND AS SUCH IS A PROPRIETARY PRODUCT

AR glasses

know that they have a doubt. When the lecturer asks questions, the students send symbols such as tick or a cross to let him/her know whether they have an answer to the question being asked. With the help of augmented reality glasses, the lecturer will be able to see symbols hovering on the student's head.

But, the drawback is that the wearer or the lecturer will look like a dork with these over-sized glasses.

Technology to ensure you don't fall asleep while driving

According to studies globally, a major factor that causes road accidents is when the driver falls asleep while behind the wheel. Now, researchers at the Leicester University are said to have come out with a brainwave reader which could be pivotal in ensuring that such accidents are avoided by stopping the drivers from falling asleep at the wheel.

According to Dr Matias Ison, who is also the project leader, the team has developed a new signal processing algorithm which would help compensate for the electrical activity created by the eye muscles as they move. The synergy created would then work in tandem with the signals captured through electroencephalograph (EEG) systems. The most important aspect of this technology is that it does not need the subject to keep his or her eyes open for the EEG to be effective.

The brain signals and eye movement can be tracked simultaneously, which can be used to add an extra parameter to the eye-tracking systems. The researchers claim that the technology will help in the improvement of the brain-computer interfaces.

Car navigation system with heads-up displays

Pioneer, a Japanese manufacturer, has come up with a car navigation system worth \$3400 that uses heads-up displays and virtual reality to guide drivers. Part of the company's Cyber Navi line, the car navigation system comes in various configurations. "A small screen is swapped for a car's
