

Renesas Power Devices for Automotive Deliver High Quality, Compact, Low Loss & Energy Efficient Car

Renesas Electronics designs, develops, and manufactures power devices that deliver an exceptionally high level of quality and reliability for Automotive. Power MOSFETs perform large-current drive control in high-temperature environments, ultra-low on-resistance through the use of ultrafine technology and package technology. Intelligent Power Devices (IPD) have built-in peripheral functions and protection functions that support system reliability improvement and unit down-sizing.

Power Device Line-up for Automotive Applications

MOSFETs

W/W Top class Low Voltage Power MOSFET Supplier Realize lowest power consumption by newest technology ANL2

- Broad product line up covers various applications
- High current capability up to 180A for EPS application
- 50% size reduction realized with 8pin HSON series (versus popular TO-252)

IPD (Intelligent Power Devices)

Extensive Product Line-up for car lighting functions and DC current loads

- Various output drive variation Single/Dual/Quad and Ron as low as 10mohm(for single)
- Excellent Robustness capability
- Suitable for lighting and heater application
