

Software in This Month's DVD

This month's EFY Plus DVD features some free filter and circuit designing tools. It also has a special tool for designing an LED matrix and other projects for design enthusiasts. For MATLAB developers, it has an interesting calibrated sound wave analyser—Virtual Sound-Level Meter

PANKAJ V.

Virtual Sound-Level Meter

Virtual Sound-Level Meter (full article on page III) is an interesting sound field analyser that reads a calibrated .wav file and implements Fast, Slow, Impulse and LEQ; A, C and Flat Weighting; Ln and Noise Dose analysis; Octave and 1/3 Octave band analysis; high-resolution FFT analysis and spectrograms. The complete package offered in this DVD includes a Windows-based executable file, along with the MATLAB runtime libraries of the software. The executable version does not require MATLAB but runs on Windows XP and the above platforms, while MATLAB users can use MATLAB source code files, which require the MATLAB and signal processing toolbox.

Supported OS: Windows
Size: 170 MB

AADE Filter Design and Analysis v4.5

AADE Filter Design and Analysis (full article on page VI) is a tool for designing Butterworth, Chebyshev, Elliptic (Cauer), Bessel, Legendre and Linear Phase: low-pass, high-pass, band-pass, and band-reject filters. This tool not only offers a complete frequency and time domain analysis for your designs, it also enables you to enter a schematic and parts list from a book or magazine for analysis or modification.

Supported OS: Windows
Size: 15 MB

ATEasy 8.0 with SP7

ATEasy provides an open architecture test executive and a rapid application development framework for faster

generation and easier-to-maintain test applications. It combines the ease of Microsoft Visual Basic and the flexibility of Microsoft's Visual C++, to offer an object-oriented, Windows programming environment. It features the framework for functional tests, ATE, data acquisition, process control and instrumentation systems. It provides all the necessary tools to develop, deploy and maintain software components including instrument drivers, test programs, user interfaces, as well as a complete and customisable test executive.

The software also includes many industry-standard hardware and software interfaces like GPIB, VXI, PCI/PXI, USB, LXI/TCP-IP, serial communication, DLLs, ActiveX, .NET assemblies, HTML, VXI plug and play function panel drivers, IVI drivers, LabView VIs, C header files and more.
