

Resistor Calculator 1.0.6

Presented here is a simple, easy-to-use freeware for Windows that saves a lot of time and effort in determining the colour code of resistors and resistance values required for LED circuits

DILIN ANAND

Every resistor is marked with colour bands that indicate its resistance, tolerance and sometimes temperature coefficient as well. You might be familiar with the mnemonics for memorising the resistor colour coding: *B. B. ROY of Great Britain has a Very Good Wife*, where the capitalised letters stand for black, brown, red, orange, yellow, green, blue, violet, grey and white, respectively.

Quite often, the whole mental calculation process of resistor codes can be an exhausting task. It also consumes much time. Sometimes you may not remember the mnemonics properly. What if the value has a denominator that is not covered by the mnemonics, such as divided-by-ten or divided-by-hundred (e.g., 0.1Ω or 1Ω)? At other times, you may get confused which colour does the first, second or third B stands for: black, brown or blue. Another common problem is that, you may not know which standard values of resistors are available in the market.

This Resistor Calculator software can be of enormous help in such situations. It helps you generate the colour coding of the resistor value you enter, determines the resistor value of the colour code you enter and lists all the standard resistor values matching your required resistance. It can also determine the value of resistor to be added in series with LED circuits!

Resistor Calculator is one of the several free software developed by AB-Tools.com. This software runs on Windows operating system. The user

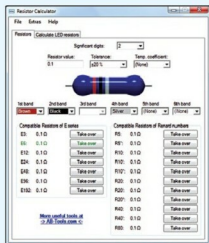

Fig 1: Home screen of resistor calculator

interface is clear and plain, which makes it a very simple tool to use even for beginners.

Features

Resistance calculation. The user can determine the colour code of the resistor to be used by inputting the resistance value. It is also possible to set the required tolerance and/or temperature coefficient and get its corresponding colour bands.

One can get the resistor value, tolerance and temperature coefficient equivalent to the entered colour combinations.

The tool automatically displays the E series and Renard's numbers of resistors closest to the input value.

LED resistance calculation. This tool allows you to calculate the required resistor value and power dissipation for a single LED as well as a number of LEDs, connected in a series or in parallel, in a circuit.

Other attributes. This program

License type	Freeware
Developer	Andreas Breitschopp, AB-Tools.com
Operating system	Windows 8, Windows 7, Windows Vista and Windows XP
Latest version	1.0.6
File size	1.29 MB

is a freeware. The users get the latest updates of this program automatically. All updates are absolutely free.

The integrated help system is simple and easy to understand. It also has an intuitive program interface. Further help and support is provided by e-mail and is also available at their website. The program is currently supported in English and German languages.

Installation

Open the executable file *Widerstand-srechmer.exe*. This will start the installation wizard, which helps you set up the program on your computer. The file *Update.exe* is included in the pack; it automatically downloads and applies the latest updates in case a new version of the software is released.

Note. The setup process gives the user options to install some other utilities such as MobiGenie (mobile phone management tool for PC), DiVapton (an adware that delivers website ratings, reviews, special offers, coupons, etc), Kingsoft Office Suite 2013 (free office software suite compatible with Word, Excel and Powerpoint) and Nationzoom.com (set as homepage and default search). The users can opt out of these by clicking on the *Skip* button in the window.
