

## BINAY - Lighting Up The Future

## BINAY LED-based HIGH, MEDIUM AND LOW Intensity Aviation Obstruction Light Beacons

As per International Civil Aviation Organisation (ICAO) requirements Available in Low Intensity, Medium Intensity and High Intensity versions (as per International Civil Aviation Organization guidelines), BINAY's patented LED Aviation Lights come with 5-year/3-year warranties

## LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

## The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick Installation; Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed intensity to allow for natural LED intensity degradation over its operating lifetime

THE BINAY LED OBSTRUCTION LIGHT IS UNDER ACCEPTED PATENT, AND AS SUCH IS A PROPRIETARY PRODUCT

## Binay Opto Electronics Pvt. Ltd.

ing. Sudden spikes or precipitous drops are dangerous and not uncommon, requiring round-the-clock monitoring," reads the blog.

Google is already moving forward into the testing phase and is in talks with the US Food and Drug Administration, whilst also seeking partners to bring the smart contact lens to market. The smart contact lens is still a long way off from mass production.

## PARAM in most efficient supercomputer list

India's supercomputer PARAM, developed by the Centre for Development of Advanced Computing (C-DAC), has been applauded in a big way. Amongst the most power-efficient computer systems, it has been ranked first in India, ninth in the Asia Pacific Region and 44th in the world. This was revealed in the Green500 List announced at the Supercomputing Conference (SC 2013) in Denver, Colorado, in the US.

India's supercomputer PARAM, developed by C-DAC

It is a known fact that supercomputers consume a lot of electrical power and in turn produce huge amount of heat, and so they need cooling facilities to ensure that they operate properly. This affects the total cost of ownership of a supercomputer. Green500 ranks computer systems across the world depending on their compute performance per watt, offering an insight into the world ranking based on energy efficiency.

## 3D printed house in 24 hours

Scientists from the University of Southern California claim to have developed a giant 3D concrete printer that can help you build a 250 sq m house in just 24 hours.

Professor Behrokh Khoshnevis, the maker of the printer, says that his innovation could be used to make a complete house, layer by layer, in a single day. The construction workers, in this process, are replaced by a nozzle on a gantry, that squirts out concrete and is capable of building a home based on a computer pattern. It is 'basically scaling up 3D printing to the scale of building,' says Khoshnevis.

With this technology one can construct a single house or a colony of houses, each with a different design along with all the conduits for electrical, plumbing and air-
