

This Month's DVD

This month's DVD available with EFY Plus magazine features circuit designing and simulation and electronic design automation tools

PANKAJ V.

Quite Universal Circuit Simulator (QUCS) 0.0.17

QUCS is a circuit simulator with well-advanced graphical user interface (GUI), which allows setting up of schematics and presenting simulation results in various types of diagrams. It supports such circuit simulation types, as DC, AC, S-parameter, Transient, Noise and Harmonic Balance analysis along with the availability of mathematical equations and use of a sub-circuit hierarchy (with parameterised sub-circuits). QUCS can also import existing SPICE models for use in your simulations.

Supported OS: Windows, MacOSx

Size: Windows (54.1MB), MacOSx (106MB)

TinyCAD 2.80.06

TinyCAD is an efficient software utility which is economical on RAM and provides fast responses with very low CPU usage. TinyCAD enables you to draw circuit diagrams, supporting standard and custom symbol libraries along with PCB layout programs with several netlist formats. It can also produce SPICE simulation netlists.

Supported OS: Windows

Size: 7.8MB

FidoCadJ 0.24.3

FidoCadJ is an easy-to-use graphical editor, with a library of electrical symbols and footprints (traditional and SMD). It is not a simulation tool but its graphical flexibility makes it an agile and effective small EDA tool for hobbyists. FidoCadJ runs on MacOSx, Linux and Windows, and can be a perfect tool to exchange sketches in forum and newsgroup discussions with just a few clicks.

Supported OS: Windows (with Java 1.5 at least), MacOSx (with MacOSx 10.4

Tiger at least), Linux (with Java version 1.5 at least)

Size: Windows (773KB), MacOSx (10.1MB), Linux (516KB)

Circuit Diagram 1.3.1.0

Circuit Diagram is an easy-to-use tool for designing of printed circuit boards (PCBs). It includes a full selection of components to create the circuit board schematics, and just by using the mouse

Screenshot of Circuit Diagram 1.3.1.0

it is possible to carry out almost all the necessary actions to create the circuit board. Furthermore, it stores the data as a graphic file, which can be read by a large amount of drawing programs, making it easier for the users to access it.

Supported OS: Windows

Size: 391KB

PLC-Logger

PLC-Logger is a useful software to log and analyse data from PLC systems. Every PLC system running a Modbus TCP server along with Siemens S7-300 or S7-400 via IBH-NetLink S7++, Siemens S7-300 or S7-400 via Ethernet interface and CoDeSys-based PLCs with the help of network variables via UDP, can be accessed by this software utility. It stores the data in a PLC log file (.PLF) and protocol configurations in a PLC configuration file (.PCF). With the enhanced graphical view, you can visualise the stored data, adjust the height and colour of the traces and display values at the position of the mouse or cursor.

Supported OS: Windows

Size: 1.7MB

Multimedia Logic

Multimedia Logic is not just a digital logic drawing system, it is an interesting tool which inputs and outputs the devices that connect directly to your computer, i.e., real devices (such as keyboard, screen, serial ports, etc) including multimedia devices like PC speaker, wave, bitmaps, etc. The intent of this system is not to necessarily build the logic circuit you design but to use what you build, to allow experimentation, to learn and to have fun.

Supported OS: Windows

Size: 577KB

gEDA suite

The gEDA suite is a toolkit of electronic design and automation tools used for electrical circuit design, schematic capture, simulation, prototyping and production. The suite provides a single, unified design environment which is easier for new users to grasp. Also, you can automate usage of the applications either using a Makefile or using a Perl script. The suite consists of GNU/Linux or Unix native programs which can be easily installed on Linux systems but installation on the other platforms requires certain dependencies. gEDA suite can be installed on MacOSx via the fink or Mac-ports package management systems whereas Cygwin environment is required on the Windows platform. Also, an alternative method to run gEDA programs on the Windows and Mac platforms is to install them under Linux in a virtual environment. The DVD features the Linux tools and the VirtualBox software for MacOSx and Windows to create a virtual Linux environment on these platforms. After installing VirtualBox, you can download and install a Linux distribution within the virtual environment.

Supported OS: Linux, MacOSx (using Fink or VirtualBox), Windows (using Cygwin or VirtualBox)
