

National Instruments RF Platform

From Design to Test

"With the ATE for Secondary Surveillance RADAR we created using PXI modular instruments and LabVIEW, our customer reduced RADAR test time by 90%. Our customer also saved 60% of cost compared to other ATEs built with traditional box instruments"

-Captronic Systems Pvt. Ltd.

"Using the software-designed NI PXI Vector Signal Transceiver and the NI WLAN Measurement Suite, we improved test speeds by more than 200 times compared to traditional rack-and-stack instruments while significantly improving test coverage"

-Qualcomm Atheros

National Instruments RF platform's software defined functionality allows engineers to prototype and test RADAR Systems, Software Defined Radio and SIGINT Systems on one end, and build high throughput ATEs for testing WLAN, LTE, Bluetooth, GPS, Analog & Digital Radio devices on the other end. Programmable FPGA based RF instruments add unique capabilities for prototyping and testing these RF systems.
