

BINAY - Lighting Up The Future

BINAY LED-based HIGH, MEDIUM AND LOW Intensity Aviation Obstruction Light Beacons

As per International Civil Aviation Organisation (ICAO) requirements Available in Low Intensity, Medium Intensity and High Intensity versions (as per International Civil Aviation Organization guidelines), BINAY's patented LED Aviation Lights come with 5-year/3-year warranties

LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick Installation; Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED intensity degradation over its operating lifetime

Binay Opto Electronics Pvt. Ltd.

44, Armenian Street, Kolkata 700 001, India

in space provides for low-cost, low-risk, highly repetitive missions to meet some unique NASA science and exploration needs.

Now a wheelchair that can be driven through tongue commands

A new form of technology is reportedly going to allow those who have lost all four of their limbs (both hands and legs) to operate wheelchairs by themselves. According to a Mashable report, the technology uses a wireless device, through which people can control wheelchairs using their tongues. Paralysis of all four limbs, known as tetraplegia, can be caused by

A tetraplegic patient on a wheelchair that can be driven with tongue commands

injuries to the spinal chord, etc. The report says that such ailments affect about 250,000 people in the US currently.

Further, according to the report, the tongue drive system has a tiny magnet, which is put inside a titanium barbell tongue piercing. In addition, the individual has to wear a headset, which contains the wireless sensors that measure the change in the magnetic field when the tongue is moved. These signals are then sent to the individual's smartphone, which converts them into commands to drive the wheelchair.

Not only that, the device can reportedly also allow users to play video games, dial phone numbers and click icons on computer screens. The tongue drive system is apparently three times faster than the currently popular sip-and-puff system for driving wheelchairs.

A technology that will make machines recognise emotions

Intel is reportedly working on something called perceptual technology which lets computers and other devices interpret and understand what is going on around it. One of the leading chip makers in the world, Intel's processors power over 80 per cent PCs over the world, but the company has not been able to make much noise in smartphones and other mobile devices. It is not giving up hope though.

According to a CNET report, the company is spending
