

NEW PRODUCTS

RECENTLY INTRODUCED IN INDIA, FROM NEAR AND FAR

COMPONENTS

High-performance diodes

Infinion Technologies AG has introduced a new transient voltage suppressor (TVS) diode series to protect antennae and front-end devices from transient voltage events. The new

ESD101x and ESD103x diodes absorb dangerous electrostatic discharges (ESD) to prevent damage to the antenna system while maintaining signal integrity.

The optimised features for antenna protection include a symmetrical bi-directional configuration with a very low capacitance of only 0.1pF to avoid mismatch and insertion loss. ESD101x and ESD103x offer high linearity as required by TX and RX systems. In order to be compliant with various regulations regarding electromagnetic compatibility (e.g. ETSI EN 300 328), the harmonic generation is minimised.

Generation 10 FPGAs and SoCs

Altera Corporation has introduced its generation 10 FPGAs and SoCs (system-on-chip), offering system develop-

ers breakthrough levels of performance and power efficiencies. Generation 10 devices are optimised based on process technology and architecture to deliver the industry's highest performance and highest levels of system integration at the lowest power.

Initial generation 10 families include Arria 10 and Stratix 10 FPGAs and SoCs with embedded processors. Generation 10 devices leverage the most advanced process technologies in the industry, including Intel's 14 nm Tri-Gate process and TSMC's 20 nm process. Early access customers are currently using the Quartus II software for generation 10 product development.

High-power LED

Everlight Electronics has launched the top-view white 1W high-power LED XI3535. The cost-effective package

provides high lumens and efficacy and is well suited for use in lighting-grade high-power LED designs such as omnidirectional LED light bulbs, directional lamps, decorative lamps, panel lights and many other general and residential lighting applications.

The package material of the XI3535 is competitively priced and thermally

efficient, allowing the LED to be driven at higher current for more lumens while maintaining good service life time. High-reliability housing brings low thermal resistance of 15°C/W and other superior quality characteristics.

Everlight's XI3535 is offered in ANSI CCT ratings from 2700 K to 6500 K and features a light efficacy of 109/115 lm/W (warm/cool white) at 350 mA and 3 V with >80 CRI. A 150mA and 6V version is also available. The typical high flux output of the XI3535 is at 105/110 lumens.

RF and microwave ICs

Analog Devices, Inc. (ADI) has introduced three RF and microwave ICs designed for high-performance transmitters and receivers used in high-dynamic-range applications, such as wireless infrastructure, defense systems, industrial, microwave point-to-point radios and more.

The new products offer breakthrough performance and expand ADI's portfolio of more than 1000 high-performance RF ICs covering the entire signal chain, from antenna to bits and back.

Incorporating ADI's high-performance broadband power detection technology, the ADL6010 microwave power detector offers unprecedented linearity and stability over temperature. Unlike alternative devices based on commonly used non-linear and non-temperature-stable Schottky diodes, the ADL6010 features a simple, proprietary linearisation system that eliminates distortion due to source loading—an important benefit in applications where a low-ratio coupler is used to extract a sample of the
