

ZigBee multi-point CT type energy power meter. This new wireless energy meter reading device can read the energy consumption of whole house/office to measure every sub-distribution.

The energy you consumed is shown on your tablet and mobile apps at real time any where you go and any time you want to know.

Digital oscilloscopes

GW Instek recently launched its GDS-2000A series of digital oscilloscopes which comes with a high-value design framework, including a 2Ga/s sampling rate, 2M record length, two or four input channels and a large screen colour LCD display. These oscillo-

scopes are suitable to perform very fast waveform acquisition and procession at an 80,000wfms/s update rate, using VPO (visual persistence oscilloscope) technology.

The GDS-2000A series, carrying bandwidths of 300 MHz, 200 MHz, 100 MHz and 70 MHz, and inputs of two and four channels, makes up a family of eight oscilloscopes in the whole series.

POWER SUPPLIES

Power supply ICs

ROHM has announced the development of compact, high-efficiency power supplies designed to drive DDR memory, microcontrollers and other components in car applications.

The BD905xx series integrates a phase compensation circuit and feedback resistor, reducing the number of external parts considerably compared with

conventional power supply ICs. This simplifies design load and contributes to end-product miniaturisation.

ROHM power supplies utilise synchronous rectification for high efficiency operation, in combination with Light Load Mode, ensuring superior performance with low current consumption under all load conditions.

Three-phase UPS

Socomec has launched a three-phase uninterruptible power supplies (UPS) product. The 250kW and 500kW Green Power 2.0 units benefit from Socomec's early investment in 3-level IGBT technology.

With this technology the Green Power 2.0 reaches 96 per cent efficiency

in VFI (voltage frequency independent) mode. As a result, the Green Power 2.0 ranges comply with environmental protection standards, saving energy without compromising on performance and availability. Moreover, these per-

formance levels have been endorsed by an independent body.

With its unity output power factor (PF=1) the new unit provides users with full-rated 500kW power in accordance with IEC 62040-3, bringing total power capacity to an unmatched 4 MW. This makes the new Green Power 2.0 the perfect solution for the most demanding data centre applications.

TOOLS & EQUIPMENT

Selective soldering system

German company InterSelect showcased its new range of selective soldering system—IS-B-335—at the Nepron show in Shanghai. This new generation of selective soldering machines are controlled via embedded PC, CAN-open technology and by InterSoft, a Windows-based software.

Another Windows-based InterPhotoScan offline programming system of the IS-B-335 is a 'point and click' PCB image package that allows the operator to complete a program in a matter of minutes instead of hours. The machines of the series are equipped with inert hot nitrogen atmosphere for the soldering process and to assist the prevention of oxidation.
