

BINAY - Lighting Up The Future

BINAY LED-based HIGH, MEDIUM AND LOW Intensity Aviation Obstruction Light Beacons

As per International Civil Aviation Organisation (ICAO) requirements Available in Low Intensity, Medium Intensity and High Intensity versions (as per International Civil Aviation Organization guidelines), BINAY's patented LED Aviation Lights come with 5-year/2-year warranties

LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick Installation; Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED intensity degradation over its operating lifetime

THE BINAY LED OBSTRUCTION LIGHT IS UNDER ACCEPTED PATENT, AND AS SUCH IS A PROPRIETARY PRODUCT

Binay Opto Electronics Pvt. Ltd.

a screen that will be solar-powered. This transparent panel will boast solar tech that could mean charging phones via sunlight can become a reality.

The company is testing the display panel with varied manufacturers currently and, if all goes well, by 2014 you might have it on your device. The company will be using stripes of standard thin-film solar cells alternating with transparent film, which will be hidden behind the screen layer on the phone's display, pretty much like a screen guard.

Goa MIT student develops touch-free phone technology

Now it is time to bid adieu to touchscreen technology. Native of South Goa's Velim, Andrea Colaco, has innovated a gesture-recognition-based technology for mobile phones, which would make touchscreen technology passe.

The innovation, which provides real-time, millimetre-accurate 3D gesture sensing on smartphones, would enable users to interact with their devices through thin air. The young PhD student from South Goa recently won the MIT (Massachusetts Institute of Technology) \$100,000 entrepreneurship competition for her innovation.

According to a report by DNA, the innovation was presented at the competition as '3dim' solution, set up by Andrea with co-founder Ahmed Kirmani. It achieves high-quality 3D sensing by employing patented signal processing methods invented at MIT by Colaco, co-founder Ahmed Kirmani, Vivek K. Goyal and Rahul Tejwani.

Industry's first four-junction solar cell device unveiled

Soitec (Euronext) announced industry's first four-junction solar cell device, which works under concentrated sunlight, putting the company on the solar-energy industry's technology roadmap at a world-class level of an outstanding 43.6 per cent efficiency.

This innovative technology was made possible through strong collaboration between solar cell device and epitaxial growth centres of expertise combined with Soitec's decades-long leadership in substrate-bonding and layer-transfer technologies. This roadmap marks a major competitiveness breakthrough in the photovoltaic industry.

Soitec's four-junction solar cell has achieved today a
