

a million dollars in seed funding from investors that keeps the clothes project on track to become a reality. However, the company is still working on the final product, which will be commercially released later.

Here comes an Android box made of cardboard

Android is surely turning into a manufacturer's and developer's delight. Both the parties have hugely benefited from the Google-owned mobility platform in their respective aspects. Android has even enabled huge desktop PCs to be converted into mini-PCs that are cheap and easy to carry yet powerful, but now there is an Android computer that comes in a cardboard box and opens like a book.

Made by VIA, the mini-PC called APC Paper has been built with APC Rock board in a cardboard and aluminium box. This device runs Android 4.0 aka Ice Cream Sandwich version with support for an external mouse and keyboard, making it the perfect desktop alternative. The APC Rock board packs an ARM Cortex-A9 processor, along with 512MB RAM and offers 4GB NAND Flash support. The device gets connectivity options like HDMI port, VGA port, two USB 2.0 ports etc.

Samsung working on flexible tablets for 2014

In order to hit the world with something revolutionary, Samsung is busy trying to get patents for flexible tablet displays. This was confirmed by Patent-bolt's new patents. If the process goes right, we will be holding flexible tablets from the start of 2014 and all from Samsung internally.

Samsung wants to diversify the technology later to smartphones, televisions and other mobile phones. In earlier news, LG had previously received interests from Korean government/manufacturers to come up with something like this and now Samsung seems to be the biggest rival.

Samsung already has plans to come up with a new OLED factory in

ARM Intros Cortex A-12 processor for smartphones

British chip designer ARM launched the new Cortex A-12 processor for smartphones, which will be sold for between \$200 and \$350 targeted at the mid-range category.

Send scented messages using Scentee smartphone add-on

Do you miss the days when people used to write love letters on a piece of paper and then added a few drops of their beloved's favorite perfume to create that romantic feeling? Presenting Scentee—a smartphone add-on that allows you to send scented along with a personalised message.

A cloud service that can spruce up the speed of your Internet

Here is a new cloud service that can offer you up to 95 per cent Internet speed, without you having to add any additional source of connectivity. Wondering how? Reportedly, this service, called Team Connectify, identifies all the available connections for your computer including your Wi-Fi, 3G/4G or Wired Connection, and then combines them.

Seagate launches 5mm laptop Ultrathin HDD

Seagate launched its latest 5mm hard drive for laptops and tablets at Computex 2013. The laptop Ultrathin HDD 6.35cm (2.5-inch) drive is available for sales from Seagate's OEM partners. The laptop HDD is offered in 320GB and 500GB capacities.

World's first 360-degree wraparound view system

Fujitsu Semiconductor Asia Pte Ltd has announced the development of MB6R24, the third-generation high-performance graphic SoCs for automotive applications. With its 'approaching object detection' functionality, drivers can check their entire surroundings in 3D from any angle.

2014 and the competition means that customers will get huge price benefits. This flexible technology is to be named 'Tablet PC' and the groundbreaking design shows a seam across the middle of the display along which a certain proportion of the display could be bent.

An eight-arm robot that would swim like octopus

European scientists are working on an octopus-inspired eight-arm robot which would be able to swim perfectly like an octopus using sculling movement—an unusual technique which requires synchronised movement of all eight limbs for swimming.

The scientists—Michael Sfakiotakis, Asimina Kazakidi, Nikolaos Paternomichelakis, and Dimitris P. Tsakiris from the Foundation for Research and Technology, Hellas, Greece—have presented their report, titled as 'Octopus-inspired Eight-arm Robotic Swimming by Sculling Movements' at the IEEE International Conference on Robotics and Automation

(ICRA) in Karlsruhe, Germany.

Engineers design paper-thin electronic skin

Stanford engineers have successfully developed a skin-like, heart monitor by using multiple layers of flexible materials that can be put under an adhesive bandage on the wrist. The monitor is actually a new type of pressure sensor that helps doctors identify stiff arteries and monitor cardiovascular problems in real time.

The heart monitor comprises a thin rubber layer mounted with miniature pyramid-like bulges. On applying pressure, these pyramids distort a little causing a measurable change in the size of the space between two halves of the device that alters the electronic field and current passing through the circuit. The sensor then gauges the pulse when worn under the wrist using an adhesive bandage.

"The pulse is related to the condition of the artery and the condition of the heart. The better the sensor, the better doctors can catch problems before they develop," the researchers said.
