

Does your design require a high performance CPU and advanced analog?

New 70 MIPS DSCs and MCUs offer integrated op-amps, comparators, and a 10/12-bit ADC in a wide range of memory and package options

With integrated analog, intelligent peripherals, and the high performance dsPIC33E and PIC24E core, Microchip's new family is enabling advanced control and sensing systems.

Microchip's latest 70 MIPS dsPIC33E DSCs and PIC24E MCUs combine a wide range of Flash memory and package options with specialised peripherals to cut the cost and size of your high-performance motor-control and sensing applications.

In addition to pin- and function-compatibility over 32 to 256 KB of Flash memory, they offer easy performance migration through code-compatibility with the dsPIC33F and PIC24F families. This new family of controllers also give you on-board op amps and a Charge Time Measurement Unit (CTMU) for on-board temperature sensing or mTouch™ capacitive touch sensing.

The new dsPIC33E and PIC24E families increase your flexibility by reducing the external component count and offering the optimum combination of CPU speed and Flash memory density for your current and future designs.
