

LAST-MINUTE CHANGES DON'T HAVE TO CHANGE EVERYTHING.

IS YOUR MCU MAKING YOUR JOB HARDER THAN IT HAS TO BE?

Introducing Precision32™

32-bit mixed-signal MCUs engineered to make your job easier.

Tired of working late because your MCU can't easily accommodate new features or last minute design changes?

Silicon Labs' new Precision32™ mixed-signal MCUs use a patented dual-crossbar architecture that allows designers to choose peripherals and pin-out placement without worrying about pre-set limitations and pin conflicts—simplifying PCB routing, minimizing PCB layers and ultimately reducing design time and system cost.

Based on the ARM® Cortex™-M3 core, the new Precision32 SiM3U1xx and SiM3C1xx MCUs include USB and non-USB devices with 32–256 kB Flash, 8–32 kB RAM and 40–80 pin packages — all available now.

Last minute changes? No problem.

Download white papers and data sheets, download free software tools and order hardware to start prototyping today. www.silabs.com/32bit-MCU

Put practically any peripheral on any pin!

Use the free Precision32 Eclipse-based IDE and AppBuilder drag-and-drop GUI to easily customize peripheral mix and pin-out placements, set up clocking modes—even generate source code!
