

CAPture VDAS Evaluation Software

Captronic Systems' CAPture VDAS or CAPture Data Logger helps you to configure easily, acquire and log the physical parameters from field sensors. Here is a feature overview of this software

ABHISHEK MUTHA

CAPture VDAS or CAPture Data Logger is an intuitive software that acquires, displays, logs the physical parameters from the sensors connected, and can even store and analyse the data. The software displays the online data when the laptop is connected to the system. The offline data can be viewed and analysed by transferring the data files to the laptop. The data files can be transferred by using the inbuilt file transfer utility (FTU).

The software allows configuration of channel parameters like channel name, unit, terminal configuration, alarms and so forth. Alarm limits like High High, High, Low and Low Low can be configured on a channel. The software allows you to define scaling and apply the scaling to a channel. It also allows you to configure triggers (time-based or threshold) to start data acquisition. The acquired data can be viewed in different display types including graph, vertical slider, numeric, gauge, horizontal slider, tank and Boolean. To get the required data in a band, appropriate filters can also be applied.

Features

CAPture Data Logger is plug-in capable and developed based on object-oriented design, which makes it modular and scalable. The software is easy to use and has a flexible user interface. It is claimed to have unrivaled hardware compatibility and a wide range of features embedded in it.
