

Thanks to EFY Team

I have been a subscriber to EFY magazine since 1987. I had successfully assembled the 'Mini Electronic Voting Machine' project, published in 1985, as my BE (E&C) final-year project in 1987.

Since then I have been getting EFY without break. Any postal delay or missing of copies is promptly addressed by your team. A big thanks to the EFY team!

EFY: Thank you for such a wonderful feedback. Such feedbacks not only boost our morale but also motivate us to produce high-quality content for our esteemed readers.

Thanks!

Once again let me tell you that all the articles published in EFY magazine are very interesting and worth reading. The 'Sensitive LPG Leakage Alarm' and 'Smart Power Control System' articles, published in EFY April issue, were the best in the 'Hands On' section, while 'Op-amp IC Tester' and 'RF-Based Motion Sensing Robot' circuits, published in the same issue, were very useful for students. I would like to recommend that at least one student or a group should construct a 741 IC (op-amp) checker for their college, in case it is not available in their college (some AIC/LIC labs don't have a 741 IC checker).

Do-It-Yourself section's ongoing series gives a good idea about Raspberry Pi, and now I am thinking of buying one piece. 'The Internet of Things Inspired Products' article in April issue was great and the best article to be included in the Innovation section. However, 'EFY Magazine Attractions (year)' column on the second last page has information about only a few forthcoming issues. It would be better if you add the whole year's attractions, as was done in the past. It would help a subscriber to identify topics in the past issues by reading only one magazine of a year, whereas the non-subscribers can use this to buy the previous issues as per their need.

'Spot An Error' Award Winners

In 'What's New in Open Source Development Boards' article published in May issue, "mbed NXP LPC 1768" is misprinted as "bed NXP LPC 1768" in the comparison table on page 80.

In the above-mentioned comparison table, the specification of Raspberry Pi should be 700 MHz instead of 700 Hz.

M. Mishra

□ In 'Accelerometer-Based Gesture-Controlled Robot' published on page 83 in May issue, the captions for PCBs of transmitter and wireless robot are switched.

Sumanta Sarkar

□ In 'EEPROM Interface for Beginners' article on page no. 87, connection sequence of control pins register-select (RS), read/write (R/W) and enable (EN) is incorrectly mentioned in the text. The correct statement should be "Control pins register-select (RS), read/write (R/W) and enable (E) are connected to port pins P3.7, P3.6 and P3.5."

EFY Article Downloads

I am a subscriber to EFY. I paid the subscription amount for EFY with CD. Later, EFY informed that the CD was discontinued and I could download any software or content freely and my subscription would be extended according to the cost difference. I assumed that I could download the content from your site or other sources as required.

Later, EFY brought out EFY Plus version of the magazine, which comes with a DVD and is priced considerably higher. If I subscribe to EFY Plus, I do not get any benefit on the amount I have paid earlier for the subscription. I could not even download the content as informed earlier. The problems encountered are as below:

1. The article says that the software is available on efymag.com website for free download. But the site does not show any link to download the software. It only shows the links to go to ezine version or PDF version of the magazine.

2. The PDF version of the magazine is not complete and only a few articles are given on the website. The site restricts downloads and gives warning that we have to pay for download.

3. Some PDFs contain circuit diagrams in very poor resolution and cannot be read properly. Downloading from old articles is also restricted.

EFY: First of all, we regret the inconvenience caused to you. We also thank

ERRATA

In 'PowerLED Retrofit Tubelight' article published in the New Products section in April issue, a key highlight of the product—BINAY Model PENTA 3300 23W 5 PowerLED retrofit tubelight—launched by Binay Opto Electronics, was missed. The product is a direct retrofit ('in-place' replacement) for the standard 1.52m (5-foot) fluorescent tubelight, which could be directly replaced in the existing 1.52m luminaire with minimal modification. The product is covered under Patent Application no. 843/Kol/2010 dt. 02.08.2010, and is claimed to be indigenously designed and manufactured in India.

you for sharing your feedback with us, and not just writing us off silently—at least that gives us a chance to make amends, or explain our case. The answers to your queries are given below:

1. All the software codes related to published projects are uploaded on efymag.com. When you open this website, it automatically takes you to the home page. The home page shows the current EFY issue. You have to click 'Download source code' link to download the code. For back issues of EFY, you need to select 'Previous Issue' option on the left side of this home page. Then you need to enter the issue (month and year) followed by clicking 'Search' button. In the next window that follows, click 'Download source code' link to download the code.

2. You seem to be using our old version of e-zine. We now have a new
