

Methode's water-based and RoHS-compliant 9100 conductive inkjet platform is formulated for thermal and piezo inkjet printing systems. The digital inkjet printing method enables circuit pattern and variable data experimentation right at the designer's desk, according to the company.

Turn Raspberry Pi into smart TV

You can easily turn a Raspberry Pi into a television set. This was shown by a blog poster on Raspberry Pi's forum. This person with user ID mmatthieu actually integrated a Raspberry Pi into a 50.8cm (20-inch) LCD monitor. Isn't that cool!

Mmatthieu successfully managed to mount the Raspberry Pi on the inside of the monitor followed by soldering the HDMI and DVI ports. After you do this, the Pi starts to take the power off the monitor itself. The project would probably be perfect with XBMC installed.

A shirt with fans and solar battery charger

No kidding, a Kolkata-based inventor is trying his hands on a new concept that he's calling 'solar summer shirt.'

This shirt will have in-built solar cells and fans to save you from harsh summers and keep you cool.

"We are trying to develop technology to fix small solar cells either into the fibre of a shirt or in its pocket," said Santipada GonChaudhury, who is a specialist in photovoltaic system design and engineering.

Scientists stop photosynthesis to generate solar power

Photosynthesis is a process in which the plants use sunlight to split water into hydrogen and oxygen, which

Baxter research robot

Rethink Robotics has announced a humanoid robot with two arms powered by a new Software Development Kit (SDK) that will allow researchers to create a host of custom applications for robots. The new Baxter Research Robot redefines the way robots can be used in manufacturing environments.

Here's a Linux supercomputer for just \$99

Adapteva, a chip-company announced at the Linux Collaboration Summit that they have managed to build their first parallel-processing board for Linux supercomputing named Parallella. Running Ubuntu Linux 12.04, the board is expected to reach customers by this summer.

Kernel source code for Google Glass released

Google has released 68.9MB file containing the kernel source code of Google Glass to help interested developers try their hands on applications.

World's first smartphone for visually impaired

This special smartphone will enable the visually-impaired to read SMSes and emails. It will work by converting the text into Braille patterns. The smartphone has been made by Sumit Dagar, whose company Kriyate Design Solutions is incubated at the Centre for Innovation Incubation and Entrepreneurship, at IIM Ahmedabad campus.

World record for highest computing speed set

How fast can a computer work? As per the latest record, it can process 504 billion events per second. This record breaking speed has been achieved by the 'Sequoia Blue Gene/Q supercomputer' at the Lawrence Livermore National Laboratory (LLNL), which was built by IBM.

Click a photo by Google Glass just by winking

Now, you have another reason to love this wearable technology. Mike DiGiovanni, an innovative developer has come up with a Google Glass app that enables users to click a photograph just by winking.

Now, camera that can see across 180 degrees

A group of researchers has developed a new insect-inspired camera system that mimics the curved, compound structure of an insect eye. This camera can take panorama pictures, i.e., across nearly 180 degrees without moving the camera and delivering exceptionally sharp images.

World's thinnest, slimmest smartphone

Huawei is reportedly working on the world's thinnest and slimmest smartphone. Some images were also leaked in the wild last month of a white colour device.

Reports suggest that the company has even gained approval from Telecommunication Equipment Certification Center MIIT in China for the Huawei P6: U06. This means that we can expect the device to show up anytime now.

LG to unveil flexible screen smartphone by 2013

After teasing the tech industry over the years about creating a phone with flexible screen, LG's vice president of mobile, Yoon Bu-hyun, had finally shared that the company is working closely with LG display to create a phone, which will sport a flexible OLED screen.

'SmartFork' to help you lose weight

Scientifically, a stomach takes 20 minutes to tell the brain that it is full and one should stop eating. Based on this concept, HapiFork has now launched a 'SmartFork' which tracks how quickly its user is eating and it starts vibrating if the bites have less than 10 seconds gap between them.

Technology to convert Sun's heat directly into solar power

A little known Vijaywada-based company Jyothi Solar Power Projects recently laid claim to have developed a technology that instantly converts solar energy into electricity. The technology, say company officials, makes use of two existing technologies by using photo-voltaic panel systems that can convert as much as 91 per cent of the Sun's energy into directly usable power.
