

## BINAY - Lighting Up The Future

## BINAY LED-based HIGH, MEDIUM AND LOW Intensity Aviation Obstruction Light Beacons

As per International Civil Aviation Organisation (ICAO) requirements Available in Low Intensity, Medium Intensity and High Intensity versions (as per International Civil Aviation Organization guidelines), BINAY's patented LED Aviation Lights come with 5-year/2-year warranties

## LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

## The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick Installation; Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED intensity degradation over its operating lifetime

THE BINAY LED OBSTRUCTION LIGHT IS UNDER ACCEPTED PATENT, AND AS SUCH IS A PROPRIETARY PRODUCT

generates electrons. These electrons help plants to produce sugar or 'food.'

A team of scientists led by Ramaraja Ramasamy, assistant professor, UGA College of Engineering, interrupted the process just before a plant converts electrons into sugar and succeeded in generating clean form of electricity from them.

The process involves extracting 'thylakoids' (structures present in the plant cell) and altering the proteins which store solar energy. The next step involves scientists intercepting the electrons with the help of a scientifically designed carbon nanotube backing that pulls them away before they are used in generating 'sugar' or food for plants.

## Flexible smartphone that can change shape

According to a report, very soon there will be smartphones in the market that will be capable of changing shapes, i.e., bendable as well as flexible in hand and pocket.

This device, as per University of Bristol and DFKI Saarbrücken researchers, is being termed as Morpheus, which can adjust to suit the user's need or current application. "The concept of self-actuated flexible mobile devices—in short, phones and portable computing terminals that can bend, twist, open like a flower, or collapse to suit different use-cases—is being explored by the team," the report added.

## Now charge your mobile phone with water

A Swedish research team has reportedly developed a water-based mobile charger called PowerTrek, which is pegged to be world's first water-activated charger that uses fresh or salt water to charge the device.

The charger has been co-created by a team from KTH Royal Institute of Technology, Sweden, and MyFC. The developers claim that it can extend battery life up to three watts.

## Flexible batteries will soon be reality

While we have long been hearing about flexible smartphones and TV screens that can be folded and can even fit in your pocket, the news of flexible batteries will revolutionise the scene further. The good news is that there are technological advances towards development of flexible batteries.
