

Dolphin Integration's SLED, SMASH and SCROOGE

In this month's software focus, we take a closer look at the three EDA solutions offered by Dolphin Integration: hierarchical schematic editor, SLED; mixed-signal simulator, SMASH; and its extension for power consumption analysis, SCROOGE

Dolphin Integration is a company based in Grenoble, France. The company produces electronic design automation (EDA) software, MEMS converters, regulators, silicon intellectual property (IP) of audio codecs, memories, and also provides custom fabless services.

Let's take a closer look at three of its EDA tools (included in this issue's accompanying DVD), their functions and the advantages they offer to design engineers.

SLED schematic editor

SLED is a hierarchical schematic entry solution by Dolphin Integration that allows designers to perform graphic entry and configuration of their designs in much less time. It efficiently blends the feasibility of linking components along with interactively and graphically configuring design contexts for hierarchical netlisting. It also improves designers' productivity by enabling the creation of true mixed-signal circuits, multi-level and multi-domain systems.

Key benefits. SLED provides a user-friendly interface. It allows file exchange with other schematic entry tools along with other tools in the design chain. It also supports the most common modelling languages such as SPICE, Verilog, Verilog-A, VHDL and VHDL-AMS, and enables modelling of micro electromechanical systems (MEMS) and multi-domain systems, thanks to the features supporting graphic VHDL link editing. SLED allows creation of multiple levels of descriptions for system or single-block validation, while also
