

Directory of Indian Electronics Industry 2013

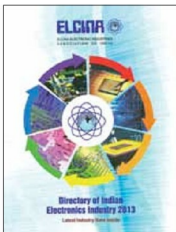

The 37th edition of ELCINA directory, which was released during Electronics For You Expo 2013, is a handy guide book of Indian electronics, IT hardware and component industries.

It is hailed as one of the most comprehensive and reliable guides for the electronics and IT communities because it is not only a business guide but also a repository of information comprising statistics, analyses, trends, projections, policy guidelines and other relevant information pertaining to the entire electronics industry.

The well-structured presentation of the directory is very helpful in quickly identifying the products and companies and getting relevant information about them. It is a must for financial institutions, investment companies, researchers and electronics and IT companies.

Some of the major highlights of ELCINA's directory are mentioned below:

1. Complete range of electronics and IT products manufactured in India
2. Database of major Indian electronics, IT hardware and design companies
3. Database of electronic component manufacturers along with their brief company profiles
4. Statistical trends in Indian IT and electronic equipment, component and material industries
5. Capsule as well as updates on government policies, quality and standards
6. Key contacts covering all relevant business related agencies and institutions in India and abroad

Price: Rs 1000 (with CD)

Compiler Design

The publication is a textbook for undergraduate students of computer science and engineering and post-graduate students of computer applications. The emphasis of the book is on the concepts of compiler design supported by working examples that provide knowledge about the practical implementation.

The book thus acts as a self-learning guide for understanding the principles and techniques of compiler design.

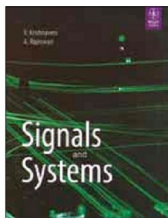

However, the book is not for the beginners as the writer has assumed that the reader already has some exposure to the concepts of data structures and algorithms. The book contains plenty of objective type questions, review questions and exercises for practice and enhancing skills in compiler design.

It focuses on concepts and techniques relating to design and development of the scanner for identifying tokens from the source code, design and development of parser for checking the syntactic structure of the programming language and generating the intermediate code with appropriate semantic actions and implementation.

The additional objective behind writing this book is to enable the users to easily design and implement the frontend of the compiler for any programming language, using compiler tools such as Lex, Yacc and JavaCC, and generate intermediate code of their own choice.

Signals and Systems

The aim of this textbook for undergraduate students of electronics and communication, and computer engineering programmes, is to provide them with a solid understanding of the theory and concepts of signals and systems through analytical examples.

The nine chapters of the book thoroughly discuss topics like basic concepts of signals and systems and different properties of systems such as linearity, time invariance, stability, invertibility and memory.
