

## BINAY - Lighting Up The Future

**BINAY LED-based HIGH, MEDIUM AND LOW Intensity Aviation Obstruction Light Beacons**

As per International Civil Aviation Organisation (ICAO) requirements Available in Low Intensity, Medium Intensity and High Intensity versions (as per International Civil Aviation Organization guidelines), BINAY's patented LED Aviation Lights come with 5-year/2-year warranties

#### LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

#### The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick Installation; Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED intensity degradation over its operating lifetime

**THE BINAY LED OBSTRUCTION LIGHT IS UNDER ACCEPTED PATENT, AND AS SUCH IS A PROPRIETARY PRODUCT**

#### Binay Opto Electronics Pvt. Ltd.

software developers to use modern hardware's multi-core central processing units and make the new language very popular.

### Japanese smartphone with OLED screen

Japan Display, a joint venture of Sony, Toshiba and Hitachi, has redefined the term 'high definition' by designing a new 13.2cm HD OLED screen featuring a 1080p resolution and an ultra-sharp picture.

Here's the first look at a blockbuster OLED screen in the works

The new screen is built with a ground-breaking RGBW pixel layout, a technology that offers an extra-white sub-pixel alongside the traditional red, green and blue pixels. The addition enhances brightness and colour representation, whilst also extending battery life in comparison with regular OLED displays and LCDs.

The Japanese company achieved the high resolution by combining its low-temperature poly-silicon (LTPS), white OLED and drive technologies.

### Get high-speed Internet service from ceiling lamps

Researchers at the Fraunhofer Heinrich Hertz Institute have said that they have found a way of high-speed data transmission from ceiling lamps.

The newly developed technology makes it possible to use standard off-the-shelf LED room lights for data transmission. Data rates of up to 800 Mbit/s were reached by this optical WLAN under laboratory conditions, while a complete real-time system exhibited at trade fairs reached data throughput of 500 Mbit/s.

The newly developed patent-protected components have now achieved a transmission rate in laboratory experiments of over 1 Gbit/s per single light frequency. As off-the-shelf LEDs mainly use three light frequencies or light colours, speeds of up to 3 Gbit/s are feasible.

The scientists said that the development of novel components for data transmission over LEDs means that significantly higher bandwidth can now be used in real-time with data throughput rates of up to 3 Gbit/s being reached in laboratory experiments.
