RECENTLY INTRODUCED IN INDIA, FROM NEAR AND FAR

COMPONENTS

DTMOS-super-junction MOSFETs

Toshiba has launched the DTMOS IV—a Gen-4 super-junction 600V MOSFET series with state-of-the-art single epitaxial process. The DTMOS IV MOSFET series provides a 30 per cent reduction in Ron·A, a figure of merit for MOSFETs, compared to its predecessor, DTMOS III.

A reduction in Ron·A makes it possible to house lower Ron chips in the same packages. This helps to improve the efficiency and reduce the size of power supplies. DTMOS IV has chips with optimised Rds(on) × Qg, Cgd and Rg that allow easy control of switching performance, a lower temperature impact on Rds(on) and best in class Rds(on) at TO-220SIS (FL): 600V, 0.065 ohm.

Isolated energy measurement chipset

Maxim Integrated Products Inc. has launched its compact MAX78700/MAX78615+LMU isolated energy measurement chipset with preloaded firmware from the company. The chipset is a highly adaptable, isolated energy measurement solution that reduces design cost, size and complexity. Designers can now measure AC or DC power usage from any phase without

the need for bulky sensors, optocouplers, or an extra power supply for the measurement subsystem by using MAX78700/MAX78615+LMU.

Engineers face unique challenges when embedding high-voltage AC (or DC) measurement into their design. As in electricity utility meters, isolation must be maintained between different phases, which historically has been accomplished using bulky current sensors.

Advanced low-power SRAM products

Renesas Electronics Corporation, a premier provider of advanced semiconductor solutions, has introduced 12 new products in the RMLV0416E, RMLV0414E, and RMLV0408E series of advanced low-power SRAM (advanced LP SRAM) devices, the company's flagship SRAM (static random access memory) range.

The new memory devices have a density of 4 megabits and utilise a fine fabrication process technology with a circuit linewidth of 110 nanometers. They provide high reliability equivalent to that of Renesas' existing SRAM products adopting a 150nm process.

TOOLS & EQUIPMENT

Altium's 3D PCB designer

Altium Limited, a global leader in smart system design automation, 3D PCB design and embedded software development, has announced new version of its flagship product, Altium Designer 14.

This designer delivers a new customer-centric platform with a heavy

emphasis on core PCB design technologies. Altium Designer 14 features support for flex and rigid-flex design, including schematic capture, 3D PCB layout, analysis and programmable design—all in a single, unified solution.

Intelligent displays with evaluation kits

Electronic Assembly has launched the EA eDIPTFT57-A intelligent display for implementing an interactive control in mechanical engineering or industrial electronics applications, as well as in all other conceivable scenarios, due to its performance characteristics and straightforward development support.

The high-contrast screen, which measures 14.47 cm (5.7 inch) in the diagonal and has LED background illumination, offers a crisp, colourful resolution of 640×480 pixels. Its most important feature, however, is the built-in intelligence that greatly facilitates developers who want to integrate the display modules in their applications.
