

BINAY - Lighting Up The Future

BINAY LED-based HIGH, MEDIUM AND LOW Intensity Aviation Obstruction Light Beacons

As per International Civil Aviation Organisation (ICAO) requirements Available in Low Intensity, Medium Intensity and High Intensity versions (as per International Civil Aviation Organization guidelines), BINAY's patented LED Aviation Lights come with 5-year/3-year warranties

LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick Installation; Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED intensity degradation over its operating lifetime

machine that will accomplish this task. This 'harvester' has an antenna, which channels the excess energy from microwaves into other devices. However, it is going to be some time before you can use a microwave instead of the charger to charge your phone. This is because the energy emitted by microwaves is kept at a low level so as not to harm human health.

According to Kawahara's research, the energy gained from running a microwave for two minutes was enough to power small kitchen devices like timers that have small batteries, for a few minutes. His research is a spin-off from NASA's research on trying to harvest the sun's wasted energy.

New technology to send audio messages via the touch of a finger

Disney Research, Pittsburgh, has added a new dimension to interpersonal communication, creating a microphone that enables a person to record an audio message, transmit it silently through his body and reproduce it with the touch of a finger.

Disney Research's Ishin-Den-Shin

Called 'Ishin-Den-Shin,' a Japanese expression for communicating through an unspoken mutual understanding, the technology turns an audio message into an inaudible signal that is relayed by the body. When the communicator's finger slightly rubs an everyday object, the physical interaction creates an ad-hoc speaker that makes it possible to hear the recorded sounds. If the finger touches a recipient's ear, the message can be heard just by the recipient.

"Ishin-Den-Shin lends an unequalled level of intimacy to digital communications," said Ivan Poupyrev, principal research scientist and head of the interaction technology group at Disney Research, Pittsburgh. "It explores the continued blurring of the boundaries between the human body, the messages we generate and the world around us. It's almost as if a person's finger can whisper in your ear or play back a message hidden in an everyday physical object," he added.

Handcrafted wooden speaker enclosures are on the way

A Texas-based company called Wathen Audiophile is developing a new form of handcrafted wooden speaker enclosure, which it has named QuarterWave. It uses a tapered acoustic
