

transmission channel designed to produce a full range of superior-quality sound.

According to the company, "The QuarterWave is designed to transform any music listener into a true audiophile as we've removed the guesswork in finding the acoustic system to brilliantly reproduce your favourite music."

On its Web page, the company reported that, "Our patent-pending QuarterWave speaker enclosure is designed to guide sound waves emitted from the rear of the speakers to prevent cancellation effects on the back surface of the speaker cone; additionally, the enclosure is designed to act as an acoustic waveguide delaying the sound waves propagated from the rear of the speakers until the rear sound waves are in phase with the sound waves emitted from the front of the speakers."

"The summation of these front and rear sound waves results in constructive interference, producing loud and undistorted live sound. Our layered construction method forms an internal acoustic transmission channel with an exceedingly rigid structure to reduce unwanted wall resonance," the company added. The company is currently looking for backers for the project.

Versatile mobile heart monitor

AliveCor, Inc. announced at the University of Southern California Body Computing Conference its new versa-

Snippets

Websites use device fingerprinting to secretly track users

A new study by KU Leuven-iMinds researchers has uncovered that 145 of the Internet's 10,000 top websites track users without their knowledge or consent. The websites use hidden scripts to extract a device fingerprint from users' browsers. Device fingerprinting circumvents legal restrictions imposed on the use of cookies and ignores the Do Not Track HTTP header.

₹ 1 million solar-powered portable house

Imagine you could travel with your home! Puducherry-based Chemin Controls and Instrumentation has built roughly 3m by 6m (10-feet by 20-feet) houses that can also act as site offices, kiosks for vending food, beverages, vegetables and groceries or cabins. These houses will have five photovoltaic modules fitted on the roof that will generate 1250kW power from solar energy. The total cost of this house is ten lakh rupees.

Meet fastest memory card in world

Here is world's fastest memory card—CFast 2.0. SanDisk, the Flash memory storage solutions company, has announced that CFast 2.0 is capable of reading data at 450 MB per second, while writing is possible at 350 MB per second. However, currently, devices that can support this memory card are scarce.

World's first shockproof digital lens camera

Nikon claims that its Nikon 1AW1 is the world's first waterproof and shockproof digital lens camera, which can handle drops from up to two metres. Plus, it can also survive in low temperatures, up to -10 degrees Celsius, which makes it freezeproof as well. And it also claims to be dustproof.

New technology that brings faster internet on old phone lines

Here's a new technology, which promises to provide a whopping gigabit-per-second data speed via age-old twisted-pair copper telephone cable. It is noteworthy that out of 580 million worldwide broadband subscribers, about 55 per cent have copper connections. Alcatel-Lucent uses copper turbo-charging technology, which has developed a new standard known as G.fast. G.fast is expected to be eventually deployed on a telephone pole, a wall, or in a manhole.

tile heart monitor that easily attaches to any compatible smartphone or smartphone case.

This new universal design includes the proprietary AliveCor ultrasound

technology that enables a clinical-quality ECG recording of the heart's activity, while minimising battery drain. The compact design is easy to install and is transferable among various mobile devices. Just like the current heart monitor, it is clinically accurate, simple and powerful.

We have today extended the benefits of our mobile ECG technology to a new range of smartphones, significantly expanding customer access," said Euan Thomson, CEO and president of AliveCor.

The FDA-cleared heart monitor attaches directly to the back of the mobile device. Current Android devices supported are the Samsung Galaxy S3, S4 and HTC One. Apple devices supported are the iPhone 4, 4S, and 5 and the new iPod Touch 5.
