

Key Questions To Ask About Your Website

- ▶ Does it matter if your website has features that your competitors don't?
- ▶ Does the idea of new customers fit in your business plan?
- ▶ Would it help your business if you got enquiries from other cities and other countries?
- ▶ What is the cost of your (or your team's) time spent in managing a complex website?
- ▶ Where would you like your online showroom to be—somewhere mixed amongst millions of websites OR visible on a popular B2B marketplace?
- ▶ Does a marketplace visited monthly by 20,000 decision makers be a good marketplace for your business?
- ▶ How much would renting a showroom on Lamington Road or Lajpat Rai Market cost you? How does that compare with Rs 1500 per month that you would invest in eleB2B.com?

eleB2B.com

devices to devices in the immediate vicinity, i.e., distances of around 10 metres or so. This higher bandwidth (4000 Mbps) level is almost 400 times faster than today's wireless networks. Each network will be responsible for handling user-mobility while the user terminal will make the final choice among different wireless/mobile access network providers for a given service. However, there should be different radio interfaces for each radio access technology (RAT) in the mobile terminal.

Smart antennae. These include the following:

1. *Switched beam antennae.* This type of antenna supports radio positioning via angle of arrival (AOA). Information is collected from nearby devices.

2. *Adaptive array antennae (Samsung has used 64 antennae elements).* Such antennae promise to improve the capacity of wireless systems by providing improved safety through position-location capabilities. This technique rejects interference through spatial-altering-position location through direction-ending measurements and developing improved channel models through angle-of-arrival channel sounding measurement.

3. *CDMA (code division multiple access) technique.* This technique converts audio analogue input signals into digital signals (ADC) in combination with spread spectrum technology. The signal is transmitted using modulation according to some predefined code (pattern), and is demodulated using the same pattern since there can be billions of code patterns which can provide privacy and sufficient security.

5G software

1. 5G will be a single unified IP standard of different wireless networks and a seamless combination of broadband, including wireless technologies, such as IEEE802.11, LAN, WAN, PAN and WWW.

2. 5G will enable software-defined radio, packet layers, implementation of packets, encryption flexibility, etc.

Chronological evolution of mobile technologies

Although the 1G system (NMT) was introduced in 1981, 2G (GSM) started to come out in 1982, and 3G (W-CDMA)/FOMA first appeared in 2001, the complete development of these standards (e.g., IMT-2000 and UMTS) took almost 10 years. It is still unclear how much time it will take to launch the standards for 5G.

5G technology will ensure the convergence of networks, technologies, applications and services, and can serve as a flexible platform. Wireless carriers will have an opportunity to shorten their return-on-investment periods, improve operating efficiency and increase revenues. In short, this will change people's lives in numerous ways. ●
