Control Your Raspberry Pi with Android Phone

The article talks about Raspberry Control app using which you can not only control your Raspberry Pi with Android devices but also design a complete home automation system

POOJA JUYAL

Raspberry Pi is a perfect playground for DIYers as they can solve a lot of real-world problems easily. This is evident from the visibility of Raspberry Pi on all platforms. Even Android and iOS apps are not left out.

There are some wonderful apps that I have recently come across on Android, which can connect flawlessly with Raspberry Pi and do amazing things. This article talks about one such app called Raspberry Control and the procedure to get it running on your Android device and control Raspberry Pi through it.

Raspberry controller

Raspberry Control is one of the most interesting Android apps for Raspberry Pi, which is very simple to use and allows you to even design a complete home automation system. This app has following functionalities:

1. SSH connection terminal
2. Control and monitoring of GPIO pins of Raspberry Pi
3. Temperature monitor using DS18B20 sensor
4. Terminal emulator for remote
5. Remote process management
6. Built-in MJPEG stream client
7. 1-wire and I²C bus management

All the functions mentioned above work with a lot of ease. The Android phone easily gets connected to Raspberry Pi with just a touch of a button and you can perform all sorts of control functions. Once connected, you can automate the whole house and control appliances using your existing Android phone. All GPIO pins can be monitored and controlled individually to switch on/off various appliances.

You can login and configure your Raspberry Pi for various applications through the SSH connection terminal. Multiple sensors can be monitored and recorded for controlling functions and much more.

Connecting Android phone with Raspberry Pi

Connecting an Android phone with Raspberry Pi through this app requires certain software already installed on Raspberry Pi. Follow below-mentioned steps to install these software on Raspberry Pi:

1. If you already have an old version (0.1) of Raspberry Control installed on Raspberry Pi, you first need to un-install it. If you are installing it for the first time, you can skip this step
