

Displaying Raspberry Pi's IP Address

Here is a simple project that displays on an LCD the IP address allotted to your Raspberry Pi operating headlessly. The programming language used is Python, which is the official language for Raspberry Pi and is very easy to learn

SOMNATH BERA

For those who like to run their Raspberry Pi always in headless mode, it becomes really annoying to guess the IP address allotted to Raspberry Pi every time they want to connect to an unknown dynamic host configuration protocol (DHCP) network. This IP address is required to remotely access Raspberry Pi using secure shell (SSH). Also, for a DHCP network this address will be different every time. So either you guess the IP address or buy a small

LCD TV with Raspberry Pi to connect to the network, which is a huge inconvenience.

To overcome this problem, presented here is a simple project

where the IP address allotted to the Raspberry Pi and the current time are displayed on a 16x2 LCD. The programming language used is Python, which is the official language for Raspberry Pi and is very easy to learn.

Circuit and working

Fig. 2 shows the pin description of GPIO connector on Raspberry Pi. The GPIO connector has pins with different functions. The device has seven true
