MAJOR CONTRIBUTORS TO THIS REPORT

Brian Bedrosian
senior director,
embedded wireless,
Broadcom Corporation

Gopakumar
director sales,
Fides Electronics

**Lavanya
Sundarajan**
project lead, PES,
Mistral Solutions

**Madhukar
Tripathi**
regional manager,
Anritsu India

Nitin Gupta
lead engineer,
Jagreen Applications,
CSR India Pvt Ltd

Oliver Smith
director sales,
Telegeis UK Ltd

**Prem Kumar
Arora**
product marketing
manager, Cypress
Semiconductor

Rahul Patel
vice president,
Broadcom
Corporation

T. Anand
managing director,
Knewron

be one of the most used technologies for accessing the Internet and thus has a high availability in consumer electronics.

Now from other RF choices, 802.11 is the preferred choice due to its scientific application orientation. "This would not interfere with other medical devices and would be more redundant from protocol and security perspective. However, if the cost is going to be one more criterion for selection, that could possibly affect the decision," explains T. Anand, MD, Knewron.

Alternatives.

1. *Need lower power consumption?* Classic Bluetooth provides lower data throughput for lower power requirements.

2. *Looking for a bigger coverage area?* You can check out WiMAX for a larger coverage area and higher data throughput.

WiMAX

The ability to provide a maximum speed of 70 Mbit/s or cover an area of up to 50 kilometres is what WiMAX provides. It can easily satisfy hundreds of equipment connecting to it and has adjustable channel sizes ranging from 1.25 MHz to 20 MHz. It is based on the

IEEE 802.16 standards, and features a well-defined quality of service (QoS) framework.

The best fit. It is an excellent alternative to deliver content that has been conventionally delivered via cable or digital subscriber line (DSL). It can also be used to provide last mile services that would help to tackle the typical bottlenecks encountered with previous systems.

"WiMAX has been in the discussion for quite a while. Its focus is on high data rates similar to that of WLAN, but with a longer range like that of cellular networks. In the meantime, 3G and 4G cellular networks (UMTS, LTE) can offer advanced data rates and are thus competing in the same market segment that WiMAX is addressing," explains Dr Heide.

Alternative.

1. *Is WiMAX an overkill for your application?* If you can make do with a smaller range and data throughput, then Wi-Fi is your solution.

Universal Mobile Telecommunications System (UMTS)

Networking and telecommunications companies like Nokia Siemens
