

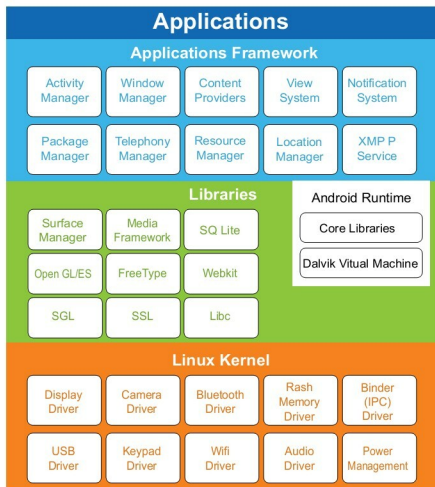

Fig. 9: Android software stack

processing power and low memory environments. Unlike JVM, Dalvik virtual machine (VM) does not run .class files, instead it runs .dex files. Dex files are built from .class file at the time of compilation and provide higher efficiency in low-resource environments. Dalvik VM (DVM) allows multiple instances of virtual machines to be created simultaneously, providing security, isolation, memory management and threading support.

ART. Google has introduced a new virtual machine known as ART, which is short for Android Runtime, in their newer releases of Android. In 5.0, DVM is completely replaced by ART.

ART has many advantages over DVM such as Ahead of Time (AOT) compilation and improved garbage collection, which boost the performance of apps significantly.

**Core Java libraries.** These are different from Java SE and Java ME libraries. However, these libraries provide most functionalities defined in Java SE libraries.

**Application framework.** These are the blocks that our applications directly interact with. These programs manage the basic functions of phone like resource management and voice-call management.

Important blocks of Application framework are:

**Activity manager.** Manages the activity life cycle of applications

**Content providers.** Manages data sharing between applications

**Telephony manager.** Manages all voice calls. We use telephony manager if we want to access voice calls in our application

**Location manager.** Manages location using GPS or a mobile tower

Solutions

## DC Electronic Loads (AC/DC also available)

Prodigit DC Electronic loads available from 75 W to 60 KW, a wide range from a leader in Electronic Loads.

### Applications

- LED Driver
- Voltage / Current source
- SMPS transient response
- Current limit testing and battery emulation
- Battery charger
- Battery discharge
- R&D / Quality Control
- ATE system
- Production testing
