Firefox OS

Firefox OS is a Linux kernel based open source OS for smartphones and tablet computers; it is set to be used on smart TVs. It is being developed by Mozilla, the non-profit organisation best known for Firefox Web browser.

Firefox OS is designed to provide a complete, community based alternative system for mobile devices, using open standards and approaches such as HTML5 applications, JavaScript—a robust privilege model, open Web APIs to communicate directly with mobile phone hardware and application marketplace.

Windows Phone

Windows is a family of mobile OSes developed by Microsoft for smart-

phones as the replacement successor to Windows Mobile.

Windows Phone features a new UI derived from Metro design language. Unlike Windows Mobile, it is primarily aimed at the

consumer market rather than the enterprise market.

BlackBerry OS

BlackBerry OS is a proprietary mobile OS developed by BlackBerry Ltd for its BlackBerry line of smartphones. The OS provides multitasking and supports specialised input devices that have been adopted by BlackBerry Ltd for use in its handhelds, particularly the trackwheel, trackball and, most recently, trackpad and touchscreen.

Ubuntu Touch

Ubuntu Touch, also known as Ubuntu Phone, is a mobile version of Ubuntu OS developed by Canonical UK Ltd and Ubuntu Community. It is designed primarily for touchscreen mobile devices such as smartphones and tablet computers.

Ubuntu Touch was released to manufacturers on September 16, 2014. Aquaris E4.5, the world's first Ubuntu based smartphone, went on sale in Europe on February 9, 2015.

Future prospects

With changing trends in the chipset industry, OS developers are not far behind. Software packages and applications are being developed to meet the demands of users and also to incorporate hardware additions like touch sensor, look-away to pause, etc. We might be seeing facial-recognition or retina-scanner software packages in the future. ●
