

WOULD YOU LIKE TO MAKE SOME MAPLE-FLAVOURED GADGETS?

Renesas is back with an entirely new developer board built to help engineers rapidly make cheaper gadgets and develop applications.

GR-KAEDE board

The GR-KAEDE (meaning Maple in Japanese) board is the latest Arduino compatible board from the same Renesas stable that brought out the popular GR-SAKURA board a couple of years ago. While the SAKURA was based on an RX63N group MCU that tops out at 100 MHz, the KAEDE is based on the newer RX64M group MCU which can clock up to 120 MHz. This translates to a straight 20 MHz increase for the maximum clock that the microcontroller can operate up to, and many functions are included.

Making Development Easier

The GR in front of both board names stands for the Gadget Renesas project. In order to make project development easier,

Renesas provides the GR-KAEDE board for use with a web compiler that can be controlled with a hypertext transfer protocol (HTTP) application program interface (API).

Arduino Compatibility

The GR-KAEDE board shares the pin layout and board footprint, as well as the library, with the Arduino boards. Even the programs have similar names to them ('sketch'). This means that Arduino UNO compatible pin-headers are ready for Arduino shields – the little modular printed circuit boards that can be plugged on top of the PCB.

These boards let a developer quickly extend the abilities of his design without having to reinvent the wheel, so
