

retouching process, it is important to separate the foreground and background of an image. A speedy, user-guided segmentation algorithm is developed in G'MIC, which is accessible through `-x_segment` command (using CLI interface) and Contours / Extract foreground [interactive] plugin filter.

Artistic filters. A wide range of artistic filters help users to play on the images. A couple of recently incorporated artistic filters in G'MIC are Engrave effect and Delaunay triangulation.

Open source projects that use G'MIC

Earlier in the article, we discussed `gmic_gimp` plugin. Let us now look at some of the other open source projects that makes use of G'MIC features.

Krita is an open source digital painting and illustration application. A lot of filters of G'MIC including

Fig. 6: Use of artistic Engrave filter for photo-to-comic conversion

the one to colourise comics work directly in Krita.

Photoflow is a full non-destructive photo-retouching program. It provides a complete workflow from RAW image development to printing. Many applications of the G'MIC filters including noise reduction were successfully incorporated in Photoflow.

EKD is a postproduction processing software for videos and images

that makes use of the video-processing application from G'MIC framework.

The gimmick on images

G'MIC framework has been actively under development by David Tschumperlé and the IMAGE team at GREYC Labs, since 2008. The scripting language understands about 1000 different commands, all-configurable, for a `libgmic` library file that takes a little less than 5MB. These cover a wide

range of image-processing applications including motion estimation and image manipulation.

People around the world make use of G'MIC either directly or through other open source software that make use of the features of this tool. ●
