

LED TVs are, in fact, just LCD TVs with LED backlights. Their entry has sent almost all LCD screens out of the picture because these offer high picture quality, lower power consumption and are extremely thin as compared to LCDs or plasmas. Moreover, consumers these days are getting more inclined towards LED TVs, and this is primarily due to the aggressive marketing initiatives pushed by different global as well as domestic brands.

A plasma screen offers premier picture quality and is ideal for movie enthusiasts and gamers who look for great picture quality. However, it consumes a lot of power and so manufacturers are now working on getting this rectified.

Another drawback of plasma screens is that these are made out of glass. This normally causes glare from reflected objects in the viewing area. There are companies like Panasonic that use anti-glare filter material to take care of this problem.

LCD TVs are economical and offer inferior picture quality as compared to LED and plasma screens. If you are not worried about great picture quality and are looking for a pocket-friendly TV, you can go for this.

However, if you are planning to buy an LCD TV, please keep in mind that LCDs are more or less inefficient in terms of power use per display size. This happens primarily because the light that is produced at the back of the screen is blocked before it reaches the viewer.

3D technology

If you are planning to go for high 3D performance, you will need a 3D Blu-ray player to watch 3D movies. Moreover, you will also need 3D glasses to view anything in 3D. Both these things are rather expensive.

The future of 3D TV depends on adoption of this product at a mass level. New technologies that are being incorporated in these

televisions are Window Walls (wall-size displays) and Visible Light Communications.

Sound

Most 127cm TVs have poor sound quality because it is impossible to fit a high-quality sound system into a lean and compact device. We recommend buyers to get a surround-sound system for an overall enhanced experience. The added advantage will significantly decrease the gap between picture and sound quality.

Internet connectivity

Almost all TVs now come with Internet connectivity, whether it is for streaming online content or getting access to online applications. Most come with built-in Wi-Fi adaptors and Ethernet ports for wired connections.

Ports

Make sure there are at least three or four HDMI ports. This is the most common technique for viewing HD images from external devices. USB ports are useful as you can view content from USB drives on your TV.

Smart TVs

An increasing number of TV sets come with built-in Wi-Fi for connecting Internet based services for running videos or apps for watching special-interest programmes, downloading on-demand movies, playing games or even posting to social media. Brands like LG and Samsung use a handy bar of icons at the bottom of the screen for this feature, while Sony uses Google Android TV platform for a better consumer experience.

Smart TVs also offer customisable homescreens and provide recommendations to viewers with regards to what programmes they should watch based on their personal tastes. **EFY**
