

A BIRD'S EYE VIEW AT THIS BIRDIE

Specifications	Description
Power supply	One lithium-polymer 3.7V 55mAh rechargeable battery
Dimension	61.39 mm x 67.25 mm
Weight	About 14 grams
Communication protocol	Bluetooth 4.0
Range	100 metres
Power consumption	821mW
Peak current consumption	19.31mA

Looking inside the birdie

drates, accurately log blood-glucose levels for monitoring and track insulin intake.

It is always confusing to see these figures in number displays. The app presents this data as graphs that help you spot your trend on the first look; you can even convert a particular set of data into PDF format to document or share with others, may be a doctor or friend. You can set reminders to help manage your daily routine and even consult with the team's specialists via video conferencing.

Measure the impact of your lifestyle

At any time of the day, take another reading and feed it into Diabeto, or just change the related factors on the app. Sit down for your analysis; but at the pace at which life is progressing, it is impossible to sit and stare at graphs multiple times a day. At such times, you can take a quick

Flexibility offered by this little birdie takes you by surprise

- Diabeto is, as of now, compatible with more than 40 glucometers that are easily available (You can find the list on www.indiegogo.com/projects/diabeto-your-friend-in-diabetes). If you are using Accucheck range of glucometers, you will need a Diabeto infrared adaptor to connect to the device.
- The hardware is just a transmission device and no data is stored in it.
- Access to data is governed by user identification and has a secure sockets layer encryption.
- If you want to use your own app for management, Diabeto application peripheral interface (API) will help you transfer readings from the glucometer. The API is compatible for both iOS and Android devices.
- Made completely from open hardware, you can subscribe to 3-6-12 month packages that offer bundled services like nutrition support. The mobile app and cloud server usage are free to use.
- Developers are working on population-tracker software for doctors, which would enable them to monitor all their patients.

The team at Diabeto (L to R): Jayesh Dhanwade, Vishal Chavan, Sheldon Lobo, Shreekanth Pawar and Hemanshu Jain

view at the display that gives you three parameters:

1. Blood-glucose reading pulled from Diabeto app
2. Standard deviation, a number that gives better analysis on blood-glucose control
3. Average glucose, a diabetes-control indicator parameter

Unique and with a purpose

With changing lifestyle, it is not uncommon to see even kids being diagnosed with diabetes today. The visually-challenged, the hearing-impaired and senior citizens are at the receiving end, too. Although

there is a device similar to Diabeto in the USA, Diabeto is an innovation from India.

Changes in hardware, suggested by Barrierbreak, an accessibility testing centre, have been incorporated in the model that will soon hit the market (as of December 2015). With alpha testing stage completed, aided by University College London, UK, and ChiMed, Diabeto is on its way to help people in not just identifying the problem but managing it to improve the user's condition. The problem with those with Diabetes is not that they are not aware, they just do not monitor it well enough. **EFY**
